Under the Federal-Provincial Rural Development Agreement, 1970-75, the province shares equally with the Government of Canada the cost of certain rural development programs. In Ontario, ARDA is heavily committed to programs in farm enlargement and adjustment, rural resource development and assistance to rural industries to increase employment opportunities for rural people.

Agricultural Manpower Services assists in recruiting, moving and placing farm workers during the planting and harvesting seasons. This service operates under a provincial agricultural manpower agreement negotiated each year by the federal and provincial governments.

The Co-operative Loans Board makes loans to agricultural co-operative associations for the construction of cold storages, feed mills, processing plants, grain elevators, potato storages, dairies, creameries and cheese factories.

The Crop Insurance Commission of Ontario, a Branch of the Ministry, provides insurance against weather, insect and disease damage to winter wheat, spring grain, forage crops, grain corn, soybeans and white beans. The cost of administration is shared equally by the federal and Ontario governments and the premium rates are further subsidized to the extent of 25% by the federal government and 25% by the Ontario government.

The Soils and Crops Branch conducts programs of applied research to provide farmers with specific recommendations for their areas. Soils and crops specialists frequently work with local branches of the Ontario Soil and Crop Improvement Association to relay this information to the farmers. Specialists also supervise county inspectors who enforce the Weed Control Act and provide specialized advice to producers of horticultural crops in Ontario.

The programs of the Veterinary Services Branch fall into the categories of service and regulation and are administered by three sections: the laboratory section, through six veterinary services laboratories, provides diagnostic, investigational, consultation and extension services to veterinarians and livestock and poultry producers, and also administers the Fur Farms Act; the meat inspection section administers the Meat Inspection Act which provides for meat inspection in slaughtering plants in Ontario that are not under federal inspection; and the regulatory and communicable diseases section administers the following Acts, policies and programs concerned with disease control, animal care and animal health extension: the Brucellosis Act, the Pregnant Mare Urine Farms Act, the Riding Horse Establishments Act, the Livestock Community Sales Act, the Dead Animal Disposal Act, the Animals for Research Act, Veterinary Assistance Policy for Designated Areas, Certified Herd Policy for Swine, Rabies Indemnification Program, Cattle and Swine Health Programs, Veterinary Extension, and Disease Reporting Programs.

The Live Stock Branch supervises numerous livestock improvement programs, and administers the Artificial Insemination Act, the Beef Cattle Marketing Act, the Dog Licensing and Live Stock and Poultry Protection Act, the Hunter Damage Compensation Act, the Live Stock Branding Act, the Protection of Cattle Act, the Provincial Auctioneers Act, and the Warble Fly Control Act. Livestock improvement programs include dairy herd improvement; beef cattle, sheep and swine performance testing; bull and ram premium policies; the federal-provincial sheep transportation assistance policy; and northern Ontario livestock assistance. The Branch makes grants available to regional livestock clubs that hold sales and livestock shows, and sponsors exhibits of livestock outside the province. A staff of livestock specialists is available to provide feeding and management advice to livestock producers.

The Ontario Stock Yards Board, which operates under the federal Livestock and Livestock Products Act, was established to provide a marketing service for Ontario livestock producers and to protect their bargaining power.

The Ontario Milk Commission, a Branch of the Ministry, is responsible for dairy programs. Under the Milk Act, and through the Ontario Milk Marketing Board and the Ontario Cream Producers' Marketing Board, the Commission is responsible for all producer-marketing of milk and cream in the province. The Ontario Milk Marketing Board directs milk from farm to plant and establishes prices. The Commission administers the Farm Products Payments Act, the Oleomargarine Act, and the Edible Oil Products Act. It also carries out the milk quality program, audits plant records, and supervises the fluid milk, milk products and central milk testing programs. The Infra Red Milk Analyzer (IRMA) is the recognized method for determining milk fat content in Ontario. The Commission licenses processors and distributors, carries on extension work with producers, operates milk-testing laboratories for the purpose of calculating producer returns, certifies butter and cheese makers, graders and testers, and does inspection work on farm and in plant.

The Farm Products Inspection Branch promotes improved methods of disease control, grading, packaging, marketing, handling, storing and transporting Ontario farm produce. This is provided for under the Farm Products Grades and Sales Act and Regulations, the Plant Diseases Act, the Containers Act, the Abandoned Orchards Act, and the Seed Potatoes Act. Under the Ontario Farm Products Marketing Board, a branch of the Ministry of Agriculture and Food, 18 producer boards market 37 commodities with a total market value of approximately \$500 million annually.

The Ontario Food Council Branch has the broad responsibility of finding methods to better co-ordinate marketing of Ontario farm products in Ontario, other Canadian provinces and abroad. The Council includes representatives of producers, processors, wholesalers,

distributors and consumers. Market development, import replacement, and expansion of food information and consumer affairs services are major areas of the Council's work. The Ontario Food Terminal, operating under the Ontario Food Terminal Act, offers farmers the services of one of the largest volume wholesale fruit and vegetable markets in Canada.

Research and education are administered by the Education and Research Division. Under the Division, the Agricultural Research Institute of Ontario recommends and co-ordinates research for the betterment of agriculture, veterinary medicine and household science, undertakes continuous research on crops, livestock and farming practices, and administers a number of services. Horticultural research is co-ordinated by the Horticultural Research Institute of Ontario, which also operates under the Education and Research Division. Fruit and vegetable product development research, and fruit and vegetable variety research are the chief functions of the Institute. The Provincial Pesticide Residue Testing Laboratory tests samples of animal, vegetable and mineral origin for herbicides, fungicides and insecticides. The Laboratory continually tests milk collected from Ontario farms for pesticide residues. The Division is also responsible for agricultural education (Section 11.3.2).

The Provincial Entomologist reports on insect control programs, as provided under the Plant Diseases and Abandoned Orchards Act, to determine pest control recommendations for Ontario crops. The Provincial Apiarist is responsible for reporting on the bee and honey industry.

The Extension Branch has personnel in each of the 54 county and district offices. Agricultural representatives relay information about agricultural research developments directly to farmers. In addition, specialists on farm management and engineering are located strategically throughout the province. The northern Ontario assistance policies of the Ministry, which vary from year to year, are also administered by the Branch. The Branch endorses and assists the 4-H Clubs and the Junior Farmers' Association of Ontario.

The Home Economics Branch conducts an extension program for rural women's groups and for girls' 4-H homemaking clubs. Programs deal with the study of foods, nutrition, clothing, textiles, home furnishings, home crafts and home management.

The Information Branch publishes and distributes several hundred publications on agriculture and food, home gardening and homemaking. News releases, radio tapes and television film clips are used to convey information to farmers on important changes in agriculture. The film library distributes more than 2,000 films annually to the public. This Branch co-ordinates a Ministry Market Information Service which provides up-to-date commodity quotations and farm weather reports to the media and individual producers on a daily basis using radio and audio-tape facilities.

The Agricultural and Horticultural Societies Branch advises and offers financial assistance to agricultural and horticultural societies and ploughmen's associations and administers the Drainage Act and the Tile Drainage Act, 1971.

The Economics Branch does research into marketing, policy, production, land use and dairying, and works with Statistics Canada to collect and publish statistics on farm production and marketing.

Manitoba. The Department of Agriculture serves Manitoba through four Divisions: Marketing and Production; Rural Development; Regional; and Administration and Program Services. Within these divisions the following branches carry out a wide range of services.

The Animal Industry Branch develops and administers policies that encourage the improvement and efficient production of different classes of livestock, including poultry; supervises the grading of cream and inspects dairy farms and dairy manufacturing plants; and administers, in co-operation with federal departments, several Acts intended to ensure a supply of quality products for consumer protection. The Soils and Crops Branch encourages the development, production and improvement of cereal, forage and special crops and horticulture and promotes proper land use through soil conservation programs; it also develops and administers policies that encourage good field crop husbandry, soil conservation, land development and weed control. The Economics Branch deals with educational and developmental programs in farm management and agricultural economics, and carries out special studies and supervises the new farm diversification program. The Marketing Branch carries out a market development, research and analysis function aimed at establishing long-term markets for agricultural products. Market intelligence and relevant information are

provided to the various branches of the Department, to producers and to agribusiness. The Veterinary Services Branch operates a diagnostic laboratory for animal diseases, administers the Veterinary Services District Act and the Veterinary Scholarship Fund Act, and works in close co-operation with practising veterinarians and the federal Health of Animals Branch in the control of livestock and poultry diseases.

The Technical Services Branch provides programs in agricultural engineering, entomology and beekeeping, and carries out a rural water service of technical assistance to rural residents installing modern farm water systems.

The Community and Family Programs Branch carries out educational and developmental programs in home economics, 4-H and youth, agricultural manpower, community affairs, rural counselling and resource analysis; it also administers the Agricultural Extension Centre at Brandon for adult education programs. The Communications Services provides a regular flow of press, radio and television services to all mass media outlets and produces and distributes over 300,000 booklets, leaflets and circulars each year. The Regional Division is made up of five regions containing 38 district offices, each staffed with agricultural representatives; district home economists are located at 15 of these locations. The major role of this Division is the extending of educational and advisory information in agriculture, homemaking and rural development to rural residents through meetings, field days, short courses and individual contact.

Saskatchewan. The Saskatchewan Department of Agriculture is composed of the following branches and services. The Agricultural Extension Branch, the main extension agency of the Department, has the primary objective of maintaining and increasing the over-all efficiency of agricultural production. It provides a basic extension program designed to ensure that the most modern farming techniques and the latest research findings are made available to farmers; provides leadership and general guidance in agricultural adjustment programs needed to bring about necessary social and economic progress; and co-ordinates and administers field programs and policies sponsored by other branches for the purpose of encouraging desirable adjustments in agricultural production and to cope with emergency situations. The Branch maintains close co-operation with other branches of the Department as well as with the University of Saskatchewan and the Canada Department of Agriculture in the three-way co-ordination of agencies known as the co-operative extension program.

The Production and Marketing Branch comprises three major Divisions: Animal Industry, Plant Industry and Veterinary. The first two provide specialist services to agricultural representatives and agriculture in field crops, weed and insect control, soil conservation, horticulture, apiculture, livestock and poultry, and administer related Acts and programs. The Veterinary Division administers the Veterinary Service District Act, the Diseases of Animals Act, and provides diagnostic laboratory services and co-operates with the federal government and local veterinarians in disease prevention and control.

The Conservation and Development Branch provides engineering services for flood control and water use projects and for irrigation development. It is responsible for construction of works for the Saskatchewan River Irrigation Project and does much of the development work for the community pastures.

The Lands Branch administers Crown land, except forest reserves and parks in settled areas, classifies it according to the use for which it is best suited and disposes of it through lease or sale. The Branch also secures land for land utilization projects, supervises new settlement projects, pays for clearing and breaking by farmers on provincial leases, operates provincial community pastures and operates training farms for people of Indian ancestry.

The Family Farm Improvement Branch gives farmers technical advice on farm buildings, farmstead planning, mechanization and materials handling. The Branch conducts research for farm water and sewage works, provides technical and financial assistance for their installation and administers the Agricultural Implements Act and the Pollution (by livestock) Control Act.

The Economics and Statistics Branch undertakes research and investigations required to formulate and evaluate policies and programs that will ensure a high level of growth and efficiency in Saskatchewan's agriculture; it collects, analyzes and distributes economic information. The Farm Management Division carries out an extension program in farm business management. Data on crop conditions, production, marketings and income are available from the Statistics Division.

Alberta. During the past year, the Alberta Department of Agriculture has been reorganized in line with a renewed emphasis on marketing expansion. The Department has seven divisions whose activities are co-ordinated by an executive committee made up of the seven division directors, the Deputy Minister, three Assistant Deputy Ministers and the director of administration. In addition, the Policy Formulation and Liaison Secretariat, through consultation with agribusiness, farm organizations, researchers, etc., advises the Department on requirements for future planning and policy.

The Marketing Division develops programs and policies that support all sectors of the marketing chain for Alberta's agricultural products. Within this Division there are four "action oriented" sections: the market development section emphasizes both export and domestic market expansion, and provides market information; the product development section encourages and supports the development of new foods manufactured from Alberta farm products; the commodities section works with producer commodity groups concerned with marketing; and the consumer marketing section provides consumer education programs primarily in the urban areas. A fifth section, known as market intelligence, supports the other four sections by providing statistical and analytical data on all segments of the Alberta food industry.

Two developmental divisions of the Alberta Department of Agriculture are responsible for policies and programs that will ensure the survival of the family farm and promote the interests of rural communities. The Extension Division co-ordinates the extension programs of every division of the Department. In association with other extension agencies, it leads in formulating and implementing district and regional programs for agriculture, family living and community development. It operates mainly through 57 district extension offices co-ordinated by six regional directors, complemented by an expanding staff of regional specialists in livestock, plant industry, engineering and home economics; leadership training is also provided. Within the Family Farm Division are several branches dealing with land management, engineering and home design, co-operative activities and credit unions, municipal relations and surface rights, as well as the Alberta Agricultural Development Corporation which guarantees or makes loans for the development of agricultural enterprises.

The Plant Industry Division administers programs and policies relating to crop improvement, crop protection and pest control, weeds, soils and fertilizers, horticulture, apiculture and special projects. It operates a crop clinic in Edmonton, a horticultural research centre at Brooks, and an extensive tree nursery at Oliver which supplies millions of trees yearly for farm planting and reforestation.

The Animal Industry Division administers legislation, policies and programs in the broad area of livestock, dairy and poultry production and in processing and marketing. Included are: setting standards for and approving public sales of sires, ROP programs for standards and qualifications for the artificial insemination (AI) industry; supervising feeder associations; brand registration and inspection; licensing of butchers, livestock dealers, stockyard and AI technicians; pound districts and sale of horned cattle. The testing, grading and purchasing of raw produce by all dairy plants are under regulation, as are standards of construction, manufacture, processing, sanitation and temperature control for dairy and frozen-food plants. A regular cow-testing service to provide the basis for breeding, feeding and culling dairy cattle is available to dairy producers, and chemical and bacteriological analyses are conducted for industrial directives. Licences are issued to poultry hatcheries, wholesalers, first receivers and truckers, and programs are conducted for control of pullorum-typhoid diseases of chicken- and turkey-hatching egg supply flocks. Extension programs, cost studies, disease tests and surveys, and research projects with respect to poultry, are also carried out.

The Veterinary Services Division provides diagnoses of livestock and poultry diseases and conducts investigations of disease conditions; provides lecture service for the University of Alberta and for other groups; promotes policies aimed at reducing losses such as vibriosis and mastitis control, stockyard inspection and swine health programs; administers regulations concerning live fur-bearing animals and pelts; and assists fur farmers in care, management and stock improvement.

The Irrigation Division provides professional and technical assistance to farmers in irrigation districts to encourage and ensure the economic viability of irrigated farm units by better conservation and management of the land, water, labour and capital resources

available; its functions also include recommending policies and implementation of programs related to over-all irrigation system improvement.

British Columbia. The Department of Agriculture comprises four Divisions: Administrative Services, Production Services, Special Services and General Services. Administrative Services is responsible for the direction of policies affecting farmers' institutes, grants, accounts, personnel and publications. Production Services includes the Apiary, Dairy, Field Crops, Horticulture, Livestock, Poultry, Farm Management and 4-H Club Branches, and district agriculturists. Special Services includes the Animal Pathology, Engineering, Entomology, Markets and Statistics, Soils, Veterinary and Plant Pathology Branches. The remainder — Agricultural and Rural Development Act (ARDA), Information Service, British Columbia Marketing Board, British Columbia Milk Board, Crop Insurance Branch and Institutional Farms — are grouped under General Services.

In addition to the headquarters staff at Victoria, the Department maintains 19 district offices in various parts of the province, as well as a veterinary laboratory and poultry-testing station at Abbotsford, a beef-testing station at Kamloops and dairy and entomology laboratories at Vancouver and Cloverdale, respectively; soil-testing facilities are installed at Kelowna.

11.3.2 Agricultural schools

All of the provinces of central and western Canada have agricultural colleges associated with universities giving courses leading to degrees in agricultural science and home economics and also providing postgraduate courses; the University of British Columbia has a faculty of Agricultural Sciences; Ontario, Quebec and Saskatchewan have veterinary colleges. In addition, all of these provinces have schools of agriculture or diploma courses offering basic training to young people intending to return to farms or interested in employment in businesses allied with agriculture.

In Alberta, these programs are offered at the vocational, technician and technologist levels by three agricultural and vocational colleges which also engage in applied agricultural research and offer programs in adult education and upgrading.

In Quebec, scientific education in agriculture is available at Université Laval and McGill University, and two institutes offer technical and technological courses in agriculture. Vocational education generally is the responsibility of the Department of Education.

The Education and Research Division of the Ontario Ministry of Agriculture and Food offers five diploma-course programs at the Ontario Agricultural College, University of Guelph, as well as at the Colleges of Agricultural Technology at Centralia, Kemptville, New Liskeard and Ridgeway.

In the Maritime Provinces, agricultural education is centred in the Nova Scotia Agricultural College at Truro, NS. This College provides the first two years of a BSc program in Agricultural Science (three years in Agricultural Engineering) with the final two years provided by other faculties in eastern Canada; in addition, the College offers a wide range of technical programs associated with farming and agribusiness and a variety of vocational courses designed to update farmers and other industry personnel.

11.4 Yearly statistics of agriculture

The collection, compilation and publication of statistics relating to agriculture is the responsibility of Statistics Canada. Valuable information is obtained through the censuses, through partial-coverage mailed questionnaire surveys and from the administrative records of government operations.

Statistics Canada collects and publishes primary and secondary statistics of agriculture on an annual and monthly basis. The primary statistics relate mainly to the reporting of crop conditions, crop and livestock estimates, wages of farm labour and prices received by farmers for their products. The secondary statistics relate to farm income and expenditure, per capita food consumption, marketing of grain and livestock, dairying, milling and sugar industries and cold storage holdings. In the collection of annual and monthly statistics, the Canada Department of Agriculture and various provincial departments, as well as such agencies as the Canadian Grain Commission and the Canadian Wheat Board, contribute statistical data and aid directly in Statistics Canada survey work. Many thousands of farmers throughout Canada send in reports voluntarily and dealers and processors also provide much valuable data. The

figures contained in this Section do not include estimates for Newfoundland; agriculture plays a relatively minor part in Newfoundland's economy and commercial production of most agricultural products is quite small. In the following Subsections, details are given for 1971 with earlier comparisons; figures for the latest year are subject to revision and it should be noted that many of those given for earlier years have been revised since the publication of the *1972 Canada Year Book*.

11.4.1 Farm income

Cash receipts from farming operations. Estimates of cash receipts from farming operations include data concerning cash receipts from the sale of farm products, Canadian Wheat Board participation payments on previous years' grain crops, net cash advances on farm-stored grains in western Canada, deficiency payments made by the Agricultural Stabilization Board, and supplementary payments. Farm cash receipts from the sale of farm products include the returns from all sales of agricultural products except those associated with direct inter-farm transfers. The prices used to value all products sold are prices to farmers at the farm level; they include any subsidies, bonuses and premiums that can be attributed to specific products but do

Total farm cash receipts

Farm cash receipts from grain

not include storage, transportation, processing and handling charges which are not actually received by farmers.

Total cash receipts from farming operations for 1971, excluding supplementary payments, are now estimated at \$4,494.9 million for Canada (excluding Newfoundland). This estimate is 8.6% above the revised value of \$4,139.0 million in 1970 and 5.4% above the average for the five-year period 1966-70 (Table 11.1). This increase in cash receipts can be attributed to increases in almost all cash receipts items with the more important exceptions of flaxseed, potatoes, tobacco, pigs and eggs (Table 11.2).

The largest increase in total cash receipts occurred in Saskatchewan which registered a rise of 31.4%. In Alberta the increase in total cash receipts amounted to 11.5% and in Manitoba a rise of 9.9% occurred. In contrast, Prince Edward Island, Nova Scotia and New Brunswick registered declines of 12.3%, 3.6% and 10.2%, respectively. Such decreases were caused mainly by lower cash receipts from potatoes and pigs.

In addition to the above income, farmers also received supplementary payments amounting to \$18.3 million during 1971, considerably below the \$58.2 million received in 1970 (Table 11.3). For both years, these payments included those made under the provisions of the Prairie Farm Assistance Act, which are made from the Prairie Farm Emergency Fund to which farmers contribute by means of a 1% levy on grain marketings, together with payments made under the Lower Inventory for Tomorrow (LIFT) program. In Manitoba, in 1971, they also included payments to farmers under the Farm Acreage Payment program. When added together, cash receipts from farming operations and supplementary payments totalled \$4,513.1 million, 7.5% above the estimate of \$4,197.2 million in 1970.

Farm net income. Two different estimates of farm net income from farming operations are prepared by Statistics Canada. Realized net income is obtained by adding together farm cash receipts from farming operations, supplementary payments and the value of income in kind, and deducting farm operating expenses and depreciation charges. This estimate of farm net income represents the amount of income from farming that operators have left for family living, personal taxes and investment after provision has been made for operating expenses and depreciation charges. The second estimate is referred to as total net income and is obtained by adjusting realized net income to take into account changes occurring in inventories of livestock and stocks of field crops on farms between the beginning and end of the year. This latter estimate is used in calculating the contribution of agriculture to the "income" component of the system of national accounts and for making comparisons with net income of non-farm business enterprises (Table 11.3).

Realized net income of farm operators from farming operations for the year 1971 is estimated at \$1,359.6 million. This is 12.5% above the revised 1970 value of \$1,209 million and 6.7% above the revised 1969 value of \$1,274 million. During 1971, increased cash receipts more than offset increased farm operating expenses and depreciation charges and decreased supplementary payments. The estimate of total farm net income takes into account changes in the value of farm-held inventories of field crops and livestock. In 1971, total farm net income amounted to \$1,593.5 million, 25% above the 1970 level of \$1,274.5 million and 1.9% above the 1969 value of \$1,564.3 million. Total operating expenses and depreciation charges during 1971 reached a level of \$3,660.7 million, 4.5% above the revised 1970 value of \$3,503.8 million.

11.4.2 Field crops

Canada's 1971 wheat crop, estimated at 529.6 million bu, was 60% above the 1970 crop of 331 million bu. The average yield per acre at 27.3 bu was 3% more than the 1970 yield of 26.6 bu. The average protein content of the 1971 crop of hard red spring wheat was 13.5% — higher than the 1970 level of 13.2% but still below the 13.9% in 1969.

Total supplies of Canadian feed grain (oats, barley, rye, corn, buckwheat and mixed grains) increased by 10% in 1971-72 compared with the previous year, due to higher levels in carryover stocks of rye combined with larger production of barley, corn and mixed grains. Total supplies of oats at 488.8 million bu were some 4% below the 509.2 million bu in 1970-71, while supplies of barley, reflecting a record production, amounted to an all-time high of 745.9 million bu and exceeded the previous year's high level of 615.8 million bu by 21%. The 1971 out-turn of mixed grains at 107.1 million bu also set a new record and surpassed the 1970 crop of 98.6 million bu by 9%. Record grain corn production, at 116 million bu, represented a 15% increase over the 1970 level of 100.9 million bu. Imports of corn in 1971-72, at about 11.7

million bu, were slightly below the 12.7 million bu of the previous year. Supplies of rye, at 34.7 million bu in 1971-72, were 5% above the 33.1 million bu in 1970-71. The out-turn of buckwheat declined by 15% from 2.8 million bu in 1970 to 2.4 million bu in 1971. The supply and disposition of the major Canadian grains are dealt with in Section 11.7.1.

Acreages, yields and prices of the principal field crops in the years 1968-71, with averages for 1963-67, are shown in Table 11.4; acreages, yields and values of field crops by province for 1970 and 1971, in Table 11.5; and acreages and production of grain in the Prairie Provinces for the years 1967-71 in Table 11.6. Table 11.7 shows the stocks of Canadian grain on hand in Canada and in the United States on July 31 for the years 1969-71, with averages for the ten-year period 1959-68.

11.4.3 Livestock and poultry

The 1971 Census of Agriculture reported 13.3 million head of cattle on farms in Canada, a 3% increase since the 1966 Census count of 12.9 million. Milk cows at 2.3 million (2 years and over) decreased by 16% over the same five-year period, continuing the trend toward reduced dairy numbers that began 20 years ago. Other cattle have shown an increase, however, reflecting the growing importance of beef production and, by 1971 Census count, these totalled 11 million head, up 8% since 1966 and 125% since the 1941 Census. Inspected slaughter of cattle in 1971, as reported by the Canada Department of Agriculture, amounted to 2.8 million, an increase of 3% from 1970, while 1971 calf slaughter at 464,240 decreased by 7% over the corresponding period, again underlining the increasing trend toward beef production as more calves are fed out and veal production consequently declines (Table 11.8).

Exports of cattle in 1971 were 245,221 head, down slightly from 247,029 in 1970. More than half of these animals (125,290) weighed less than 200 lb. and went to the United States. Imports at 90,707 head, (89,713 from the United States), were up by 74% and consisted largely of slaughter cattle going to eastern markets. Beef exports at 143 million lb. remained relatively constant but imports dropped 23% to 173 million lb. due to lower imports from Australia and New Zealand.

The Canada Department of Agriculture reported that the weighted average price of choice slaughter steers at Toronto for 1971 was \$34.30 compared to \$32.25 in 1970, and \$29.55 for the 1966-70 average.

The 1971 Census adjusted count for pigs at June 1, 1971 was 7.6 million, an increase of 41% over the 1966 count of 5.4 million and a record high. On the other hand, the number of farmers reporting pigs decreased 21%, from 154,328 in 1966 to 122,481 in 1971. Poor international grain markets coinciding with depressed prices for pigs resulted in farmers holding their pigs for finishing on their own grain stocks, mainly in the western provinces which were most affected by the poor grain market. Pigs slaughtered in federally inspected plants in 1971 numbered 9.7 million, as reported by the Canada Department of Agriculture, an increase of 18% over 1970 gradings. The increased gradings lowered prices and the weighted, average price at Toronto (\$ per 100 lb.) for index 100 pigs in 1971 was \$25.80 compared with \$32.20 in 1970 and \$35.70 in 1969.

The number of sheep and lambs on farms reported in the 1971 Census was 860,789, a decrease of 16% from the 1,019,997 reported in the 1966 Census, and the number of farmers reporting sheep was 14,090, down 34% from 21,453 over the same period. Inspected slaughter of sheep and lambs in 1971 was 205,082, up 13% from 1970. Imports of live animals also increased, from 28,121 in 1970 to 37,412 in 1971, with the increase due entirely to higher imports from the United States. Imports of mutton and lamb, on the other hand, decreased 25% to 52.8 million lb. in 1971.

Poultry on farms and their values in 1971-72 are given in Table 11.9; production and consumption of poultry meat are shown in Table 11.10.

11.4.4 Dairying

The number of dairy cattle on farms has been declining gradually for many years. Despite the over-all decrease in numbers, total milk production in Canada had remained fairly constant by an increase in output per cow until in 1971 when it declined 536 million lb. from the previous year (Table 11.11). Production is concentrated in central Canada, Quebec and Ontario accounting for about 73% of the total quantity.

Table 11.12 shows that the farm value of milk production in Canada for 1971 was \$768.5 million, an increase of approximately 3.5% over 1970. The value of milk used in factories in

1971 was \$390.5 million (62% of total production) and fluid milk sales amounted to \$329.3 million (30% of total production).

Production of creamery butter, which in 1971 amounted to 286.8 million lb. and required 38% of the total national milk output, represents a decline of 12.5% from the 1970 figure (Table 11.13). Quebec accounted for almost half of the total output, followed by Ontario with 28%. Per capita consumption, shown in Table 11.14, was 15.3 lb., slightly lower than in 1970.

Both output and consumption of cheese have been increasing gradually during the past few years. The total production of factory cheese (Table 11.13) for 1971 was 247.9 million lb. compared with 215.3 million lb. for 1970, and per capita consumption (Table 11.14) of all varieties of cheese, excluding cottage cheese, was 12.7 lb. compared with 11.8 lb. for 1970. Exports of cheese amounted to 32.8 million lb. in 1971, a decrease from 39.4 million lb. in 1970. Ontario accounted for 44% of the output and Quebec 49%.

Total production of concentrated whole milk products, which include condensed milk, evaporated milk, whole milk powder, partly-skimmed evaporated milk and others, increased over the previous year, with the exception of condensed milk which decreased slightly. Total production of concentrated milk by-products decreased due to a 16.9% drop in production of skim milk powder.

11.4.5 Fruit, vegetables and other farm products

Fruit. Commercial fruit growing in Canada is confined almost exclusively to rather limited areas in the provinces of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. Nova Scotia production is centred mainly in the Annapolis Valley and New Brunswick production in the Saint John River Valley and Westmorland County. In Quebec the fruit growing districts are the Montreal area, the North Shore area, the Eastern Townships and the Quebec City district. Ontario fruit is grown in all the counties adjacent to the St. Lawrence River and the Great Lakes as far west as Georgian Bay; the Niagara district, however, is by far the most productive region. In British Columbia the four well-defined fruit areas are the Okanagan Valley, the Fraser Valley, the Kootenay and Arrow Lakes district and Vancouver Island. The climate elsewhere in Canada is not generally suitable for commercial tree-fruit culture. Apples and small fruits are produced commercially in the provinces named but tender tree fruits and commercial vineyards are largely limited to Ontario and British Columbia.

By far the most valuable fruit crop produced in Canada is apples and in 1971 the farm value for this crop was \$26.6 million. The main outlet for Canadian apples is the fresh market which absorbs about 63% of the production each year and the volume of apples for processing is about 37% of production. In Nova Scotia nearly 66% of the crop is processed but smaller proportions are processed in the other producing provinces.

Strawberries are grown commercially in all provinces for which tree-fruit statistics are prepared, as well as in Prince Edward Island, but are produced over a somewhat wider area than are tree fruits. Raspberries are grown commercially in Nova Scotia, New Brunswick and Quebec but the bulk of the crop is produced in Ontario and British Columbia. The Fraser Valley of British Columbia is the most important producing area. Wild blueberries are harvested on a commercial scale in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick and Quebec. This crop is indigenous to certain areas in these provinces and a large percentage of the crop is frozen and exported. There is also some production of cultivated blueberries, particularly in British Columbia.

A marketing system has been developed for distributing fresh fruit from the specialized production areas to all parts of the country and a large proportion of the deciduous fruit consumed in Canada is grown domestically. Considerable quantities of apples, strawberries and blueberries are exported. Canning and processing industries have developed in the fruit growing districts and, although the importance of the processing market varies with different fruits, it provides a valuable outlet for substantial proportions of most Canadian-grown fruit crops.

Table 11.15 shows the estimated commercial production of fruit, by kind, for 1969-71.

Vegetables. Estimates of acreage and production of commercial vegetables in Canada are prepared for all provinces except Newfoundland and Saskatchewan. Ontario is the largest producer, followed by Quebec and British Columbia. A wide variety of crops are grown in these three provinces and a somewhat smaller range in the Maritime Provinces, Manitoba and Alberta.

Canning, freezing and processing of vegetables are carried on in the important producing areas. The estimates in Table 11.16 cover output of commercial growers for processing and for sale on the fresh market but do not include averages or production of vegetables grown for home use.

Eggs. Table 11.17 shows production, utilization and value of farm eggs, by province. In 1971, egg production at 499.3 million doz was 0.7% higher than in 1970 and 11.4% higher than the record 448.2 million doz produced in 1959. The number of layers increased slightly in 1971 over 1970, the rate of lay per 100 layers rose to 20,902 from 20,888 and the farm selling price of eggs averaged 33.0 cents per doz compared with 35.4 cents. The Atlantic Provinces produced 7.7% of all eggs in 1971; Quebec, 16.0%; Ontario, 38.9%; the Prairie Provinces, 25.6%; and British Columbia, 11.8%.

Honey. As shown in Table 11.18, honey production in 1971 was below that in 1970. Honey is produced commercially in all provinces except Newfoundland and yields vary to some extent from year to year. Alberta is consistently the largest producer, accounting for almost 42% of the total output in 1971. Honey bees are kept in some fruit-growing districts for pollination purposes and are also used for pollination of certain seed crops. To facilitate storage, shipment and uniformity of quality, large quantities of Canadian honey are pasteurized. Beekeepers' marketing co-operatives are active in several provinces. In 1971, Canada exported 24.2 million lb. of honey valued at \$4.3 million, more than two and a half times the quantity exported in 1970. Exports went mainly to Britain, the United States, the Federal Republic of Germany, Japan and the Netherlands.

Sugar beets and beet sugar. Sugar beets are grown commercially in Quebec, Manitoba and Alberta and beet sugar factories are located in these provinces. In Quebec, commercial production is centred in the St-Hilaire area of the Eastern Townships; Alberta, where sugar beets are grown under irrigation, produces the largest crop. Acreage, yield and value of sugar beets for the years 1964-71 are shown in Table 11.19, together with quantity and value of shipments of beet sugar.

Maple sugar and maple syrup. Maple syrup is produced commercially in Nova Scotia, New Brunswick, Quebec and Ontario. The bulk of the crop comes from the Eastern Townships of Quebec, a district famous in both Canada and the United States as the centre of the maple products industry. Virtually all of the maple products exported go to the United States with the larger proportion moving as sugar, although substantial quantities of syrup are also shipped. Much of the syrup sold in Canada is marketed in one-gallon cans direct to the consumer from the producer but a considerable amount of both sugar and syrup is sold each year to processing firms. Production and value of maple sugar and maple syrup, by province, are shown in Table 11.20.

Greenhouse operations. The total area operated under glass in 1970 and 1971 by reporting firms, plus estimates for non-response in Essex county in Ontario, amounted to 25.4 million sq ft and 25.8 million sq ft, respectively, while the total value of growers' sales stood at \$55 million in 1970 and \$64.7 million in 1971. The results of this survey are published in Statistics Canada publication *Greenhouse industry* (Catalogue No. 22-202).

Nursery industry. An annual survey is made of the nursery industry; figures published are based on data reported by firms and individuals returning questionnaires. In 1971 the nursery trades industry had a total revenue of \$50 million. Approximately one third of this represents grower sales of traditional fruit and nursery stock and one third was earned by supplying the increasing demand for contracted services. The results of this survey are published in Statistics Canada publication *Survey of Canadian nursery trades industry* (Catalogue No. 22-203).

Tobacco. Canada produces several types of leaf tobacco but by far the most important is the flue-cured or Bright Virginia type. This is grown mainly in Ontario, along with considerable quantities of burley and smaller amounts of dark (air-cured and fire-cured) tobacco. Quebec produces smaller quantities of these types as well as some cigar and pipe tobacco, and small flue-cured acreages are also harvested in Prince Edward Island, Nova Scotia and New Brunswick. Although the total acreages planted were lower in 1971 than in 1970, the yields per acre in all producing areas were higher and total production increased from 221.9 million lb. in 1970 to 224.4 million lb. in 1971. The average value per lb. declined fractionally from 64.4 cents in 1970 to 64.1 cents in 1971 (Tables 11.21 and 11.22).

No information is available on the production of cigarettes for domestic consumption but, on the basis of domestic sales reported to Statistics Canada by manufacturers, the number of cigarettes sold rose from 46,582.2 million in 1969 to 49,822.5 million in 1970 and to 50,864.4 million in 1971.

Wool. Estimates of production of shorn wool in 1971 at 3.6 million lb. were 5% higher than in each of the previous three years. However, during the same period the price per lb. declined gradually from 47.8 cents to 31.2 cents and the total value from \$1.7 million to \$1.2 million, until 1971 when the price per lb. and total returns were sharply reduced by about 50% to 16.4 cents and \$598,000, respectively, due to discontinuance of payments under the Agricultural Stabilization Act. At the same time, over the four-year period apparent consumption of wool, about 90% of which is imported, decreased by 35% to 39.7 million lb.

11.4.6 Prices of agricultural products

The index of farm prices of agricultural products (Table 11.23) was designed to measure changes occurring in the average prices farmers receive at the farm from the sale of farm products. In comparing current index numbers with those prior to August 1971, the following points should be considered. Prices of all western grains used in the construction of the index prior to that date are final prices; all later figures are initial prices only for wheat, oats and barley. Any subsequent participation payments will be added to the prices currently used and the index revised upward accordingly. Average cash prices per bu of major Canadian grains are given in Table 11.24 and yearly average prices per 100 lb. of Canadian livestock in Table 11.25.

11.4.7 Food consumption

Food consumption figures represent available supplies, including production and imports, adjusted for change of stocks, exports, marketing losses and industrial uses. All calculations are made at the retail stage of distribution, except for meats for which the figures are worked out at the wholesale stage. The amount of food actually eaten would be somewhat lower than indicated because of losses and waste occurring after the products reach the hands of the consumer.

All basic foods are classified under 14 main commodity groups. The total for each group is computed using a common denominator for the group, for example: milk solids (dry weight) for the dairy products group; fat content for fats and oils; and fresh equivalent for fruits. All foods are included in their basic form, that is, as flour, fat, sugar, etc., rather than in more highly manufactured forms.

The series in Table 11.26 represents the official estimates of yearly supplies of food moving into consumption, expressed in pounds per capita, for the years 1965-69 as an average for comparison with the years 1970 and 1971. Production of meats from slaughter in Canada, total supply, distribution and per capita disappearance of meats and lard are shown in Table 11.27. All estimates are on a cold carcass-weight basis except canned meats, which are in terms of product.

11.5 1971 Census of Agriculture

This Section presents a limited amount of information from the 1971 Census of Agriculture; details are contained in Volume IV — Parts 1, 2 and 3 of the 1971 Census of Canada. A list of the special and advance census reports that have been released is available on request.

Number of census-farms. For both census years, 1971 and 1966, a census-farm was defined as a holding of one acre or more with sales of agricultural products valued at \$50 or more during the 12 months prior to the census. The number of census-farms in Canada declined 15% to 366,128 in 1971 from 430,522 in 1966, indicating an acceleration of the trend since 1941 toward an ever-decreasing number of census-farms (Table 11.28).

Farm areas. The total area of census-farms in 1971 was 169,668,614 acres, a 2.6% decrease from the 174,124,828 acres recorded in 1966 (Table 11.29). The Maritime Provinces, Quebec and Ontario all reported significant decreases in farm acreage. Only Newfoundland, Alberta and British Columbia showed an increase, the increase in Newfoundland being due to the establishment of new community pastures. The Yukon Territory and the Northwest Territories recorded a slight increase in acreage. For Canada, the 108,148,877 acres of

Number of census-farms

improved land for 1971 was virtually unchanged from the area recorded in 1966. A 4.3% increase in summerfallow to 26,740,727 acres from 25,631,683 acres in 1966 nearly offset small decreases in cropland, improved pasture and other improved land. The area of unimproved land decreased 6.8% to 61,519,737 acres in 1971 from 65,970,451 acres in 1966. Woodland, decreasing by 18.8%, accounted for the majority of this loss, while other improved land decreased 3.4%.

Economic classification of census-farms. Census-farms were divided into 12 economic classes according to the total value of products sold during the past calendar year (Table 11.30). Such a classification serves as a measure of the productive size of census-farms in Canada. The former division of census-farms into “commercial” and “small-scale” farms has been dropped, since what may be felt to be a commercial farm in one region might be considered small-scale in another. The group classified as “institutional farms, etc.” includes experimental farms, community pastures and institutional-type farms regardless of the amount of sales of agricultural products.

Type of farm. Table 11.31 shows that, with the exception of farms classified as “institutional farms, etc.”, all census-farms with sales of \$2,500 or more were classified as one of ten major product types. A criterion of 51% or more of total sales was used for this classification. For example, a census-farm was typed as a poultry farm if 51% or more of the total agricultural sales for the farm was obtained from the sale of poultry products. However, it was classed as a

dairy-type farm if 40% to 50% of total sales was obtained from dairy products, provided the sale of dairy products together with the sale of cattle and calves amounted to 51% or more of the total sales. Under these criteria, it was possible for a farm to qualify for more than one product type. To prevent this possibility, the ten product types were given a priority rating in the order listed in Table 11.31.

Size of census-farms. In 1971, 49% of the census-farms in Canada contained less than 240 acres compared with 53% in 1966 (Table 11.32). This decrease in the number of small holdings again indicates the trend toward consolidation of farms into larger holdings. However, the wide variation in the distribution of farms by size between provinces continues. In the Atlantic Provinces 71.8% of the census-farms were under 240 acres in size; in Quebec and Ontario 78.4% were under 240 acres; in the Prairie Provinces only 17.9% fell below 240 acres; and in British Columbia the percentage was 78.5 (Table 11.32).

Age of census-farm operators. The proportion of census-farm operators under 35 remained at approximately 15% of the total. Similarly, the number of operators in the middle age groups, 35-54, remained at 52% and those in the older age groups, 55 and over, remained at 33% (Table 11.33).

Farm machinery. Table 11.34 indicates that between 1966 and 1971 farm trucks increased by 7.3%, swathers 12.6%, pick-up hay balers 11.6% and forage crop harvesters 17.3%. Decreases were reported for automobiles, 8.9%, tractors, 0.3% and combines, 4.4%.

11.6 International crop statistics

Tables 11.35 and 11.36 are based on estimates published by the Foreign Agricultural Service, United States Department of Agriculture, and give the acreages and production of wheat and the production of oats and barley for the harvests of 1970 and 1971 with averages for the years 1965-69, in the leading countries of the world.

11.7 The marketing of agricultural products

11.7.1 The grain trade

Major changes were made in delivery quota policies for the 1970-71 crop year, reflecting recommendations of a special quota committee and bringing Wheat Board quota policies into line with provisions of the federal government's Wheat Inventory Reduction Program. A separate acreage basis was established for producer deliveries of wheat, and the acreage basis for other quota grains was revised. Producers were permitted to select alternate delivery points, thus improving their delivery opportunities. These modifications resulted in a system more responsive to market requirements by enabling the Board to call for delivery of specific kinds of grain to meet sales commitments, and contributed significantly to the export program. For additional details regarding delivery quota policies, see Statistics Canada publication *Grain trade of Canada* (Catalogue No. 22-201). Supply and disposition of Canadian grain for the crop years ended July 31, 1970 and 1971 are shown in Table 11.37.

11.7.1.1 The 1970-71 crop year

Estimated domestic supplies of wheat, oats, barley, rye, flaxseed and rapeseed totalled 2,629 million bu in the crop year 1970-71, a decrease of 3% from the 1969-70 total of 2,710 million bu. Marketings of these grains in the Prairie Provinces amounted to 785.3 million bu, a 19% increase over the 1969-70 level of 660.7 million bu and a 23% increase over the ten-year (1959-60 - 1968-69) average of 637.9 million bu. Marketings of wheat during the 1970-71 crop year, at 384.3 million bu, were down 7% and accounted for 49% of total deliveries. Marketings of the other major grains (totals for 1969-70 and ten-year averages, respectively, in parentheses) in millions of bushels were: oats 58.3 (20.9, 43.2); barley, 235.9 (168.4, 86.6); rye, 11.6 (7.6, 7.2); flaxseed, 33.7 (22.1, 15.9); and rapeseed, 61.5 (28.5, 12.2).

Wheat. Domestic supplies of wheat in 1970-71 amounted to 1,340.2 million bu, 13% below the 1969-70 record total of 1,536.1 million bu. The 1970 production of wheat was 331.5 million bu in contrast to 684.3 million bu in 1969, a decrease largely due to acceptance of the LIFT program by growers in western Canada, and carryover stocks were 1,008.7 million bu compared with 851.8 million bu. Exports of wheat and flour in terms of wheat during the 1970-71 crop year, at 435.2 million bu, were 26% above the 346.5 million bu exported in 1969-70, 37% more than the long-term average of 317.4 million bu and 7% more than the ten-year average of 405.6 million bu.

During the crop year 1970-71, marketing of western Canadian wheat was again conducted by the Canadian Wheat Board on a one-year Pool basis, the initial payment being \$1.50 per bu basis No. 1 Northern in store Thunder Bay or Vancouver. On February 11, 1972, the Board announced that a final payment involving the distribution of \$74.4 million would be made on wheat delivered by producers during the 1970-71 crop year.

Grain exports. The 1970-71 exports of bulk wheat, at 409.4 million bu, were higher than the preceding year's total of 317.7 million bu and above the recent ten-year average of 369.2 million bu. During the 1970-71 crop year, the People's Republic of China with purchases of 88.3 million bu remained Canada's principal wheat customer for the third consecutive year. Britain was the second largest wheat market with imports of 64.6 million bu, while Japan purchased 40 million bu and moved into third place on the list of Canada's wheat importers. Sales to the Federal Republic of Germany at 22.7 million bu increased sharply during the crop year under review and moved that country to fourth position. Other leading markets during 1970-71 with quantities in millions of bushels (1969-70 figures in parentheses), were as follows: India, 17.1 (16.5); Brazil, 15.5 (nil); Italy, 15.4 (12.1); Algeria, 14.3 (1.5); Egypt, 14.0 (3.2); Iraq, 13.5 (0.6); USSR, 12.1 (47.3); and Syria, 10.6 (4.2).

The export movement of Canadian wheat flour during the 1970-71 crop year amounted to 10.8 million cwt (24.8 million bu of wheat equivalent), some 8% below the 1969-70 total of 27 million bu. Cuba was Canada's major customer for wheat flour, taking 5.4 million cwt or 12.4 million bu of wheat equivalent and accounting for half of the crop year total. Britain, with imports equivalent to some 2.1 million bu, accounted for 8% of the crop year total and Ceylon and Indonesia imported 1.5 million bu and 1.2 million bu, respectively.

Combined exports of oats, seed oats, barley, rye, flaxseed and rapeseed (including customs exports of oatmeal and rolled oats, and malt in terms of grain equivalent) amounted to 269.9 million bu during the crop year 1970-71. This figure was sharply above both the comparable 1969-70 level of 138.1 million bu and the ten-year (1959-60 - 1968-69) average of 80.1 million bu. Exports of Canadian oats in bulk totalled 13.1 million bu during 1970-71, the highest level of exports recorded since 1965-66 (15.3 million bu), compared with 4.8 million bu shipped during the previous year. The Federal Republic of Germany was the principal market for this grain with purchases of 5.8 million bu; the Netherlands and Italy, at 2.5 million bu and 2.1 million bu, respectively, provided the bulk of the year's increased exports. Other shipments went to the United States, 0.9 million bu; Switzerland and Gibraltar, 0.6 million bu each; and Ireland, 0.4 million bu. In addition, exports of Canadian oatmeal and rolled oats amounted to the equivalent of 23,000 bu in 1970-71 against 61,000 the year before.

Barley exports, at 172.3 million bu, reached an all-time high during the 1970-71 crop year, and more than doubled the 82.7 million bu of 1969-70. Italy became Canada's largest market for this grain with imports of 33.2 million bu, an increase of 20.5 million bu over the previous year's total. Britain was the second largest market as purchases by that country rose to 29.5 million bu in 1970-71, registering a gain of 10 million bu over those of 1969-70. The Federal Republic of Germany and Japan also increased their imports in 1970-71, from 6.3 million bu to 28.7 million bu and from 16.9 million bu to 25.7 million bu, respectively, over 1969-70. Shipments to other major customers in millions of bushels (totals for the previous year in parentheses) were: the Netherlands, 9.9 (1.0); United States, 8.5 (10.3); Poland, 4.5 (4.8); Iraq, 4.4 (nil); Israel, 4.1 (5.3); Spain, 4.0 (nil); Norway, 3.7 (nil); Taiwan, 3.1 (0.7); Belgium and Luxembourg, 2.8 (0.1); Syria, 2.4 (nil); Ireland, 2.3 (0.5); and Denmark, 1.9 (0.4). In addition to the exports of Canadian barley as grain, shipments of malt were the equivalent of 7.3 million bu, some 31% above the 1969-70 figure of 5.6 million bu. During 1970-71 malt was exported to 23 different destinations, the major markets being Japan, 2.7 million bu; Venezuela, 0.7 million bu; Britain, Philippines and United States, 0.6 million bu each; and Brazil and Peru, 0.4 million bu each.

Exports of Canadian rye during the 1970-71 crop year amounted to 8.9 million bu, the best volume of clearances since 1966-67. Japan continued to be the principal market for this grain, importing some 4.8 million bu in 1970-71, more than twice the 1969-70 figure. Other major markets importing Canadian rye were as follows: Britain and Poland, 0.9 million bu each; the Netherlands, 0.7 million bu; Norway, 0.6 million bu; and United States and Portugal, 0.5 million bu each.

During 1970-71, clearances of Canadian flaxseed moving overseas amounted to 21.2 million bu, surpassed only by the record 21.6 million bu in 1956-57. The leading market for

Producer deliveries of grain

Canadian flaxseed was the Netherlands with imports amounting to 6.8 million bu, followed by Japan, 4.3 million bu; the Federal Republic of Germany, 3.2 million bu; Britain, 1.9 million bu; Belgium and Luxembourg, 1.3 million bu; and Spain, 1.2 million bu. In the 1970-71 crop year, trade in rapeseed amounted to 46.8 million bu, an all-time high, and more than double the 22.2 million bu of the previous year. Japan continued to be Canada's major market for this oilseed with purchases of 16.0 million bu, an increase of some 11% over 1969-70. Clearances to the Netherlands at 9.1 million bu; France, 4.5 million bu; the Federal Republic of Germany and Italy, 4.4 million bu each; India, 3.6 million bu; and Pakistan, 2.2 million bu, were well in excess of last year's exports to these countries.

11.7.1.2 The 1971-72 crop year

The 1971-72 crop year opened with carryover stocks of the six major grains (wheat, oats, barley, rye, flaxseed and rapeseed) at 1,054.2 million bu. Stocks of wheat at August 1, 1971 amounted to 734.2 million bu, significantly lower than the 1,008.7 million bu held in storage a year earlier. August 1, 1971 stocks of the other major grains in millions of bushels (1970 figures in parentheses) were: oats, 125.4 (141.3); barley, 144.3 (200.1); rye, 12.7 (10.6); flaxseed, 26.6 (6.0); and rapeseed, 11.0 (3.6).

Domestic production of the six major grains amounted to 1,633.9 million bu in 1971-72. Wheat increased from 331.5 million bu in 1970-71 to 529.6 million bu in 1971-72, resulting in a total supply for the 1971-72 crop year of 1,263.7 million bu. Oats declined from 367.8 million bu to 363.5 million bu, for a supply of 488.9 million bu in 1971-72. A record 601.6 million bu of barley was produced which, combined with opening stocks, also resulted in a record supply for 1971-72 of 745.9 million bu. Rye production declined to 21.9 million bu from 22.4 million bu in 1970-71, resulting in a supply for 1971-72 of 34.7 million bu. Flaxseed production decreased to 22.3 million bu from 48.9 million bu in the previous year, and rapeseed production at 95 million bu surpassed by a wide margin the 1970-71 crop of 72.2 million bu; total supplies of these oilseeds in 1971-72 were: flaxseed, 48.9 million bu and rapeseed, a record of 106 million bu.

Farmers' marketings of the six grains during the 1971-72 crop year amounted to a record 952.2 million bu, an increase of 21% over the 1970-71 total of 785.3 million bu. Four grains registered an increase in 1971-72 over 1970-71, with oats and flaxseed the exceptions.

Marketings of wheat at 517.5 million bu were 35% above the 384.3 million bu the previous year and accounted for 54% of all deliveries during 1971-72. Marketings of the other major grains in millions of bushels (1970-71 totals in parentheses) were: oats, 32.3 (58.3); barley, 295.5 (235.9); rye, 15.5 (11.6); flaxseed, 21.6 (33.7); and rapeseed, 69.8 (61.5).

During 1971-72, Canada exported a record 823.8 million bu of the six major grains, including 24.7 million bu of wheat flour in terms of wheat equivalent. Export clearances of wheat rose to 478.1 million bu, some 17% above the 1970-71 total of 409.4 million bu and nearly 27% more than the ten-year (1960-61 - 1969-70) average of 377.5 million bu. Exports of oats at 10.2 million bu were below the 1970-71 total of 13.1 million bu. Barley exports rose to a record 224.3 million bu from the 1970-71 level of 172.3 million bu and rye exports also climbed to 10.8 million bu from 8.9 million bu. Flaxseed exports registered gains in 1971-72, rising to 25.7 million bu, but rapeseed exports declined to 42.6 million bu.

Total domestic consumption of wheat in Canada declined slightly to 170.6 million bu in 1971-72 from 170.8 million bu in 1970-71, due to a relative decrease in the estimated quantity fed, which more than offset an increase in seed requirements. Domestic utilization of oats declined to 360.1 million bu, from 370.5 million bu, and rye to 8.4 million bu from 11.4 million bu. Barley rose to 321.4 million bu from 291.9 million bu. Domestic disappearance of flaxseed increased to 7.2 million bu from 7.1 million bu, and that of rapeseed from 18 million bu to 21.6 million bu.

Stocks of wheat at the close of the crop year on July 31, 1972 stood at 589.4 million bu, 20% below the closing stocks of the previous year. Year-end stocks of the other major grains were: oats, 118.3 million bu; barley, 194 million bu; rye, 15.5 million bu; flaxseed, 16 million bu; and rapeseed, 41.8 million bu.

11.7.1.3 The International Wheat Agreement 1971

A United Nations Wheat Conference was convened under the auspices of the United Nations Conference on Trade and Development (UNCTAD) at Geneva in January 1971 to negotiate a new agreement to replace the International Grains Arrangement (IGA) 1967 which was to expire on June 30, 1971. Canadian objectives at the conference were to conclude a meaningful international agreement to provide market stability and to assure adequate price levels for efficient wheat producers. It was also made clear from the outset that Canada would not accept an agreement that would put her wheat exports at a competitive disadvantage and that an acceptable agreement would have to provide equity in rights and obligations among exporters and between exporting and importing countries.

Under the 1949 and subsequent International Wheat Agreements (IWA), Canada, alone of the major exporters, had a firmly established price range, with No. 1 Northern being the reference wheat and Thunder Bay the reference port. The IGA 1967 was an attempt to strengthen pricing provisions by having firm price ranges established for the principal grades of wheat of all major trading nations. Unfortunately, the IGA minimum prices were breached by certain exporting countries even before the Arrangement became operative.

Prior to the 1971 International Wheat Conference, the United States rejected the IGA pricing formulae as a basis for a new agreement. It was proposed that there be a return to the old IWA formula under which only Canada would have a specified price range. The latter proposition was unacceptable to Canada.

The Conference was unable to reach agreement on either the establishment of reference grades or the establishment of reference points and related price equivalents. As a result, it was not possible to devise meaningful price provisions which met the objectives of market stability and equity of rights and obligations among exporters and between exporting and importing countries.

The result of the Conference was the formulation of the International Wheat Agreement 1971, which became effective for the period July 1, 1971 to June 30, 1974. It contains neither price provisions nor related rights and obligations but provides that the International Wheat Council shall request the Secretary-General of UNCTAD to convene a conference when it is judged that the price question can be successfully negotiated.

The International Wheat Council continues as a forum for international consultation and co-operation, and as an agency for the collection and dissemination of information on the world wheat situation. Membership in the new Wheat Trade Convention remains the same except for the admission of the USSR as an exporter, and Brazil, Taiwan, Panama and Syria as

importers. The agreement also provides for a continuous review of the world wheat market situation through the Advisory Sub-committee on Market Conditions.

The Food Aid Convention under the new agreement is similar to that under the IGA 1967. Except for the withdrawal of the United Kingdom and Norway, membership in the convention is the same as under the previous pact. The nine member countries have pledged themselves to supply, as food aid to developing countries, a minimum of 4 million metric tons of grain or grain products suitable for human consumption, or cash equivalent, compared with a total obligation of 4.3 million tons in 1970-71.

11.7.1.4 Miscellaneous grain trade statistics

Lake shipments of grain. The 1971 navigation season opened at the Canadian Lakehead on April 10 and closed on December 29. Details of lake shipments for 1970 and 1971 are given in Table 11.38.

Licensed grain storage. Total grain storage capacity in Canada, licensed under the provisions of the Canada Grain Act by the Canadian Grain Commission, amounted to 699.5 million bu at December 1, 1970, compared with 700.1 million bu at the same date in 1969 (Table 11.39). On July 31, 1971, 62.1% of the licensed storage capacity was occupied as compared with 73.6% on the same date of 1970.

Production and exports of wheat flour. Production of wheat flour in the 1970-71 crop year amounted to 38.5 million cwt and wheat milled for flour totalled 87.5 million bu; both were below the corresponding totals for 1969-70. Of the wheat milled for flour, approximately 71.9 million bu were western Canadian spring wheat (other than Durum) and the remainder was made up of 8.6 million bu of Ontario winter wheat, 5.2 million bu of Durum wheat and 1.8 million bu of other types. Utilization of milling capacity, based on a daily operating potential of some 170,000 cwt, averaged 76.9% in 1970-71 compared with 77.7% in the previous year. Figures for the crop years ended July 31, 1969-71, including exports of wheat flour, are given in Table 11.40.

11.7.2 Livestock marketings

Marketings of cattle through public stockyards, shipped direct to packing plants and on export, and to country points in another province amounted to 3.4 million head in 1972, up 3.1% from 3.3 million in 1971. All western provinces had increases, the largest (13.6%) occurring in Saskatchewan. In the East, marketings were generally lower although there was a sharp increase in New Brunswick. The movement direct to public stockyards in Canada was down slightly in 1972 compared with the previous year, but the movement direct to packing plants at 1.9 million head was up 5.9%. Total marketings of calves in 1972 amounted to 1.2 million, practically unchanged from the 1971 total; marketings were up slightly in the West and Ontario, but generally well down in the other provinces. There was an increase in quality of cattle marketed with higher numbers grading choice, especially in the case of heifers. The weighted average price per 100 lb. of choice slaughter steers at Toronto in 1972 was \$37.20 compared with \$34.30 in 1971, and well above the five-year average (1965-69) of \$30.98. Good feeder steers at Toronto had a weighted average price of \$39.75 compared with \$34.15 in 1971.

Pig marketings totalled 9.4 million, down 7% from 10.2 million in 1971; decreases occurred in all provinces. The average weight of pigs slaughtered in federally inspected plants in 1972 was 164.2 lb., practically unchanged from the previous year. The 1972 weighted average price for index 100 pigs at Toronto was \$35.10 compared to \$25.80 in 1971.

Sheep and lambs shipped to public stockyards, packing plants, direct on export, and from country points in one province to those in another totalled 270,948 in 1972, up 7% from 253,120 in 1971. This increase was due entirely to increased marketings in the West which more than offset a decrease in the East. Not only were marketings higher but the 1972 price for good lambs at Toronto was \$31.50 per 100 lb. compared with \$30.65 in 1971.

11.8 Government aid and controls

11.8.1 The role of government in the grains industry

Government's interest and involvement in the grains industry predates Confederation and is a record of policies relating to land use and settlement; transportation; grain elevators, storage, handling and forwarding; marketing methods and opportunities; income security; and the many ramifications of international competition and the search for international

co-operation in the sale of grain. The federal government's role is currently focused in the Department of Agriculture, the Department of Industry, Trade and Commerce, and in the semi-autonomous bodies reporting to Parliament through Ministers of the Crown — the Canadian Grain Commission and the Canadian Wheat Board, as well as the Canadian International Grains Institute. To provide a forum for co-ordination, consultation and consensus on industry recommendations to government, the Canada Grains Council has been established. To co-ordinate, review and recommend federal policies, having due regard to all organizations concerned, a Special Advisory Group on Grains has been formed. The Minister responsible for the Canadian Wheat Board is designated as primarily responsible for federal government grains policy.

11.8.1.1 Grains Group

In 1970, the Minister responsible for the Canadian Wheat Board organized the Special Advisory Group on Grains (known as the Grains Group) made up of policy advisers drawn from the Canada Department of Agriculture, the Department of Industry, Trade and Commerce, the Canadian Transport Commission and the railways. Under the Minister's direction the Grains Group examines the problems of the grains industry in the areas of production, transportation and handling, and marketing, proposes measures to adjust grains production to known and projected markets, identifies and develops market opportunities, and stimulates more efficient handling and transportation of grain of the types and quantities required to meet domestic and export market demands. It also co-ordinates, reviews and recommends federal policies for grains and grain production. Implementation of recommended policies subsequently adopted by the government is through government departments or other agencies concerned with the grains industry.

Production. The Canada Department of Agriculture conducts a wide-ranging research program in plant breeding and production methods to improve varieties, yields and quality of grains for which there is a domestic and export demand. A recent innovation has been the provision, well in advance of spring planting, of information on initial prices to be guaranteed to farmers for the new crop of wheat, oats and barley, and on minimum deliveries to be accepted by the Canadian Wheat Board during the crop year.

Other programs are the Grassland Incentive Program, which encourages producers to increase their forage acreage, maintain their grain acreage and production in relation to market demands for grain and, at the same time, provide increased forage for an expanding livestock industry; and the Two-Price Wheat Program, which provides some stability to the domestic wheat market by ensuring that producers receive \$3.00 per bu for that portion of wheat used for domestic human consumption, while maintaining the price of wheat to domestic millers at \$1.95½ for the top grade of milling wheat regardless of variations in export prices.

Transportation and handling. The Grains Group studies of the grain handling and transportation system, undertaken to identify the constraints and alternatives to the system and to provide a base for discussion and subsequent action, were released in August 1972, and are available from the Canada Grains Council, Winnipeg, which is judged to be the forum most representative of the parties concerned. Through the Grain Handling and Transportation Committee formed under the Grains Council, producers and other organizations have direct participation in deciding on future transportation and handling developments in the industry.

The government has purchased 2,000 specially designed hopper cars to maintain the movement of grain to export positions, and the Canadian Wheat Board has been assigned the responsibility of ensuring their most effective use. Record shipments amounting to 817 million bu were handled in the 1971-72 crop year, and with the new equipment it is expected that in the 1972-73 crop year a new record will be achieved.

Marketing. In order to broaden the assistance provided for sales and market development of grains, oilseeds and products, the services and programs of the Department of Industry, Trade and Commerce are consolidated in a new Grain Marketing Office, which maintains regular contact with the Canadian Wheat Board, other agencies and organizations concerned with grain marketing, trade commissioners abroad and the private trade with the objective of maximizing exports from the grains sector. The Rapeseed Utilization Assistance Program provides for an increased level of product development grants through the Rapeseed Association of Canada. A broad program of trade promotion is maintained, including participation in Canadian trade fairs.

The Market Development Program for Grains and Oilseeds, designed to extend the scope of initiative, particularly in the private sector, has been established, and a Market Development Fund of up to \$10 million annually has been created to promote the marketing of grains, oilseeds and other agricultural products. Assistance under the Program is available to Canadian companies, agencies, industry associations, universities, institutes, and similar entities for projects contributing to a sustained increase in grains and oilseeds sales. Projects have been implemented or are under consideration covering a broad range of activities, including grain handling, storage, processing, market testing of products, developing new products or processes, and conducting feasibility studies related to expansion of exports of grains, oilseeds and their products.

Credit. Canada has been selling grain on credit since 1952. Originally, terms of up to three years were offered at commercial rates of interest. The need for a broader and more competitive program was recognized and in 1968 the Prime Minister stated that the government would review and amend credit facilities for the sale of Canadian grain in order to improve its competitive position in export markets. Subsequently, Cabinet approved a revised and improved credit program which includes terms of up to three years at competitive interest rates, and concessional terms of over three years at subsidized interest rates.

Most credit sales of Prairie grain on terms of three years or less are financed under Section 12 of the Canadian Wheat Board Act. Credit sales not administered by the Board, including sales of other than western grains, on terms of three years or less and sales on terms of more than three years are insured under Section 27 of the Export Development Act. In the 1971-72 crop year, sales of almost 160 million bu of wheat, or about one third of total wheat exports, were made on credit. In addition, over 16 million bu of barley were exported on credit. A large volume of grain is being sold on credit in the 1972-73 crop year.

Food aid. The Canadian Food Aid Program has expanded sixfold since the early 1960s. For the years 1969-70 to 1971-72, an average of \$90 million annually was spent by the government on gifts of food, mainly wheat and flour, to needy countries. About 85% of the total food aid is given to foreign governments under a bilateral program. Any revenues that accrue to recipient governments are channelled to economic development activities in the recipient country. Most of the balance of the funds in the aid program is made available for purchases of Canadian wheat, flour and other foods by the World Food Programme of the Food and Agriculture Organization. Much of this food is distributed directly to workers abroad in full or part payment for their labour on economic development projects, but it may also be used for emergency relief and for special feeding projects, for example, in schools and in hospitals. In addition, Canada makes regular contributions, averaging \$1 million, in flour, to UNRWA for Palestinian refugees. Rapeseed is included in the aid program. In the current year some \$20 million of the food aid budget is being spent on rapeseed and rapeseed oil for India and Bangladesh.

11.8.1.2 The Canadian Grain Commission

The Canadian Grain Commission was established by the Canada Grain Act on April 1, 1971. It replaced the Board of Grain Commissioners for Canada which was originally established by the Canada Grain Act of 1912. It is composed of a Chief Commissioner and two Commissioners and is under the jurisdiction of the Canada Department of Agriculture. Headquarters of the Commission is at Winnipeg and other offices are situated across Canada, with the largest units at the port areas of Vancouver, Thunder Bay and Montreal.

The Commission is responsible for administration of the Canada Grain Act, including inspection, weighing and storage of grain; for fixing maximum tariffs for charges by licensed elevators; for establishing grain grading standards; and for operation of the Canadian government elevators located at Moose Jaw, Saskatoon, Calgary, Edmonton, Lethbridge and Prince Rupert. All operators of elevators in western Canada and elevators in eastern Canada handling western-grown grain for export, as well as grain dealers in western Canada, must be licensed by the Commission and must file security by bond or otherwise as a guarantee for the performance of all obligations imposed upon them by the Canada Grain Act or by the Canada Grain Act Regulations. On a fee basis, the Commission provides mandatory official inspection, grading and weighing of grain, as well as registration of terminal elevator and eastern elevator receipts. The Economics and Statistics Division of the Commission is the basic source of information on grain handled through the Canadian licensed elevator system.

The Commission's Grain Research Laboratory conducts surveys of the quality of each year's grain crops and of grain moving through the Canadian elevator system. It provides information on the quality of varieties and grades of grain to the Inspection Division, collaborates with plant breeders in studies on new grain varieties and undertakes basic research in relation to quality characteristics of cereal grains and oilseeds. With the introduction of the protein factor in segregating wheat grades, the Commission has extended and decentralized its protein-testing facilities and is now able to test samples drawn from carlots of wheat and make the results known to terminal elevator operators prior to unloading cars at the terminals. The Laboratory monitors this protein testing to ensure uniformity among testing units, and also assists in testing the quality of cereals developed by plant breeders to determine the licensing potential of the variety.

The Commission has four Assistant Commissioners — one in Alberta, two in Saskatchewan and one in Manitoba — who investigate complaints of producers and inspect primary (country) elevators in their respective provinces. All grain elevators with their equipment and stocks of grain may be inspected at any time by officials of the Commission.

The Commission sets up western and eastern grain standards committees which participate in establishing grain grades and grade specifications and recommend standard and export standard samples for various grades of grain. It also appoints grain appeal tribunals to hear appeals against the grading of grain by the Commission's inspectors; decisions of these tribunals are final.

11.8.1.3 The Canadian Wheat Board

The Canadian Wheat Board was established under the Canadian Wheat Board Act of 1935 for the purpose of "marketing in an orderly manner, in interprovincial and export trade, grain grown in Canada". The legislation established the Wheat Board as the sole marketing agency for Prairie wheat, oats and barley sold interprovincially or internationally. Other crops, such as rye, rapeseed, flaxseed, buckwheat and mustard are marketed by the private grain trade.

The sale of Prairie-grown wheat, oats and barley is carried out in one of two ways: sales negotiated directly by the Wheat Board, and those negotiated through grain exporting companies acting as its agents.

Delivery of the kinds, grades and quantities of grain needed by customers is essential to the Wheat Board's marketing program. This is accomplished in two stages: the first involves the delivery of grain by the producer from his farm to the local country elevator; the flow of grain from farms to country elevators is regulated under a delivery quota system which enables the Wheat Board to call for the delivery of the kind and grade of grain required to meet market commitments, and, at the same time, to allocate delivery opportunities equitably among all grain producers; the second stage involves the movement of grain from country elevators to large terminal positions in eastern Canada, at Thunder Bay, at Churchill, and on the west coast. The transportation of grain to terminals on the west coast, at Thunder Bay and at Churchill is carried out by the railways under maximum tariffs established under the terms of the National Transportation Act. The forwarding of grain from Thunder Bay to eastern positions is done largely by lake vessels under freight rates negotiated by the Wheat Board and by private shippers with lake vessel operators. Extensive planning and a high degree of co-ordination within the grain handling and transportation industry are required to carry out the complex task of moving grain from country elevators to forward positions. The Wheat Board, which co-ordinates the entire movement, programs rail shipments from country elevators to terminals on a weekly basis in accordance with sales requirements.

The producer receives payment for his wheat, oats and barley in two stages: an initial payment price is established by Order in Council before the start of a crop year; this price, less handling costs at the local elevator and transportation costs to Thunder Bay or Vancouver, is the initial price received by the producer and is, in effect, a guaranteed floor price. If the Wheat Board, in selling the grain, does not realize this price and the necessary marketing costs, the deficit is borne by the federal treasury; after the end of the crop year when the Board has sold all the grain or otherwise disposed of it in accordance with the Canadian Wheat Board Act, the Board, if authorized by Order in Council, makes a final payment to producers.

Under the Prairie Grain Advance Payments Act, administered by the Board, producers may receive, through their elevator agents, interest-free cash advances on farm-stored grain in

accordance with a prescribed formula. The purpose of this legislation is to make cash available to producers pending delivery of their grain under the quotas established.

Under provisions of the Temporary Wheat Reserves Act, the Minister of Finance, out of the Consolidated Revenue Fund, pays to the Wheat Board the carrying charges on wheat in excess of 178 million bu in commercial storage at the end of the crop year.

11.8.1.4 The Canadian International Grains Institute

The Canadian International Grains Institute, first named the Canadian Grains Institute, was incorporated in July 1972; it operates in affiliation with the Canadian Wheat Board and the Canadian Grain Commission and financial responsibility is shared by the federal government and the Canadian Wheat Board. It is designed to contribute to the maintenance and enlargement of markets at home and abroad for Canadian grains, oilseeds and their products, and offers instructional programs to foreign participants selected from countries purchasing these commodities and to Canadian participants associated with the grain industry. Courses are offered in grain handling, transportation, marketing, flour milling, bread baking and macaroni manufacturing, and lectures and practical training are given in analytical methods used in processing and utilization of grains and oilseeds. The Institute is located in the Canadian Grain Commission Building in Winnipeg. Facilities include classrooms, conference rooms, offices, library, laboratories, a 9-ton, 24-hour-capacity flour mill and a pilot bakery.

11.8.1.5 The Canada Grains Council

At the suggestion of the Prime Minister, the Canada Grains Council was established in 1969 to improve co-ordination within the industry and to assist in reaching a consensus within the industry on recommendations to government. Its further aim is to assist in improving Canada's share of world markets for all grains and grain products and to expand their use in domestic markets. The administration costs of the Council are shared by the government and by industry members. Membership is open to all non-governmental organizations and associations whose members are directly engaged in the production, handling, transportation or marketing of grain and grain products. The Council's day-to-day activities are run by a Secretary-General and his staff.

In its four years of operation, the Council has demonstrated the capacity of the industry to work together on matters of mutual interest, and has made a number of recommendations to government on issues either referred to it by government or initiated by the Council itself. The Council has also issued a number of publications in line with its market promotion functions. These include *Feed grains of Canada*, printed in six languages, *Overseas mission reports*, and its *1972 Evaluation of the domestic feed grain market*; in addition, it publishes a regular marketing information bulletin.

In the summer of 1972, the Council undertook the vital task of assessing and proposing changes in Canada's grain handling and transportation system. The committee formed for this purpose from all segments of the industry will review various reports on the subject, and will propose changes to the system for efficiency and for economy of operation in the future.

11.8.2 Government involvement in other farm products

Governments in Canada at both the federal and provincial levels have from the beginning enacted measures to improve and expand the performance of the agricultural sector. Originally, the emphasis was on production increases and the control and eradication of pests and diseases. Gradually, however, with rising production and increasing specialization on the part of farmers, problems in marketing began to emerge.

To ensure quality, inspection and grading procedures and standards were established, but the periodic collapse of prices caused by bumper crops and intensified by the general inability of large numbers of producers to bargain on an equitable basis with far fewer buyers has been a much more difficult part of the marketing problem.

The first attempts to provide bargaining power to producers was the organization of voluntary marketing co-operatives. All provinces eventually passed legislation for incorporation of these co-operatives, and most of them also provided additional assistance in various forms. Federally, the introduction of the Agricultural Products Marketing Act provided for financial guarantees to producers willing to market their crops on a pooling-of-returns basis. Further information on the role of co-operative organizations is given in Chapter 17.

Although much co-operative marketing was successful, particularly in the first years of incorporation, it was found that the voluntary aspect for many marketing co-operatives was a serious weakness, many members dropping out in good times and making their own deals. Thus, it was felt that a type of marketing organization was needed with the legal power to control the output of all producers of a certain product in a certain area, and as a result marketing control legislation was adopted providing for various types of boards and agencies.

11.8.2.1 Product controls

The federal and provincial departments of agriculture co-operate in establishing and enforcing grades of quality standards for various foods. Some control over size and types of containers used for distribution of agricultural products is exercised by the Canada Department of Agriculture, and the Department of Consumer and Corporate Affairs enforces regulations pertaining to weights and measures.

Standards related to health and sanitation in food handling are developed and enforced at all three levels of government — municipal, provincial and federal. Examples of provincial and municipal action include laws pertaining to pasteurization of milk, inspection of slaughter-houses and sanitary standards in restaurants. At the federal level, inspection by the Health of Animals Branch of the Canada Department of Agriculture of all meat carcasses that enter into interprovincial trade is required; the Foods and Drugs Directorates of the Department of National Health and Welfare have wide responsibility for food composition standards; and the Department of Consumer and Corporate Affairs has jurisdiction over advertising.

11.8.2.2 Marketing controls

The Agricultural Products Co-operative Marketing Act (RSC 1970, c.A-6) was passed in 1939 as a result of a federal government decision to assist orderly marketing by encouraging the establishment of pools that would give the producer the maximum sales return for his product, less a maximum margin for handling expenses agreed upon in advance. The Wheat Co-operative Marketing Act was passed at the same time but was in effect for only one year, and the Agricultural Products Co-operative Marketing Act now covers the marketing of all agricultural products except wheat produced in the Canadian Wheat Board area.

The purpose of this Act is to aid farmers in pooling the returns from sale of their products by guaranteeing initial payments and thus assisting in the orderly marketing of the product. The government may undertake to guarantee a certain minimum initial payment to the producer at the time of delivery of the product, including a margin for handling; sales returns are made to the producer on a co-operative plan. The guaranteed initial payment may be up to a maximum of 80% of the average price paid to producers for the previous three years, the exact percentage to be recommended by the Minister of Agriculture who enters into an agreement with the selling agency for the product. For 1971 crops, agreements were made for the marketing for processing of corn and apples in Quebec and of beans in Ontario.

Milk control legislation was enacted in nearly all provinces prior to 1940. Most provinces finance these milk control agencies partly from public funds and partly through the collection of licence fees and assessments from those engaged in the fluid milk industry. Milk control agencies have the authority to license those engaged in the fluid milk industry and can revoke licences for failure to conform with agency orders.

In all provinces with such boards, the milk control board or similar agency sets the minimum price which distributors in specified markets may pay producers for Class I milk, that is, milk actually sold for fresh fluid consumption. In British Columbia, a formula is used as a guide in determining minimum prices to producers. Most provinces set either minimum or maximum wholesale and retail prices for fluid milk. Quebec sets a minimum and maximum price range. Saskatchewan sets minimum prices applicable to all retail milk sales and maximum prices applicable to milk sales from retail wagons, as well as minimum-maximum price range at the wholesale level. Minimum prices are in effect in Alberta, Nova Scotia and New Brunswick. Maximum prices are set in Manitoba and no control is exercised over milk prices at the wholesale and retail levels in Ontario and British Columbia. In these three provinces some degree of price competition has developed between store sales and home delivery.

The powers given to milk control boards include: authority to inquire into all matters pertaining to the fluid milk industry, to define market areas, to arbitrate disputes, to examine

the books and records of those engaged in the industry, to issue and revoke licences and to establish a price for milk; and authority to require a bond and periodic reports from distributors, payments to be made to producers by a certain date each month, distributors to give statements to suppliers or to give notice before ceasing to accept milk from any producer, and producers to give notice before ceasing to deliver milk to any distributor.

The Ontario Milk Marketing Board, a producer-controlled agency, was officially established by the Milk Commission of Ontario on November 1, 1965. Certain powers were assigned to it by the Commission regarding the production, marketing and transportation of milk and it also has the power to set the prices that milk processors must pay to their suppliers.

The Canadian Dairy Commission, established in 1966, was a new departure in the area of agricultural marketing because it was the first national marketing board to be established since creation of the Canadian Wheat Board in 1935. The Commission has the power to purchase any dairy product and package, process, store, ship, insure, import, export, or sell or otherwise dispose of any dairy product purchased by it. The Commission may also make payments to producers of milk and cream for the purpose of stabilizing the price of these products.

A comprehensive milk marketing plan was agreed to by the Canadian Dairy Commission and the milk marketing agencies of Ontario and Quebec in January 1971 establishing a market-sharing quota system for industrial milk and that portion of milk shipped by fluid producers which is used for manufacturing purposes. The agreement also covered cream shippers in Quebec, and cream shippers in Ontario entered the plan on April 1, 1971. Prince Edward Island was the third province to enter into the program, which became operative in that province on December 6, 1971. Producers in Alberta entered on April 1, 1972 and Manitoba and Saskatchewan came under the program on July 1, 1972. More than 95% of the manufacturing milk and cream sold in Canada now comes under the market-sharing program. With the market-sharing arrangement, each producer receives a market price related to Canadian price support levels for deliveries up to his market share. Prices for deliveries over market share are related to world prices for surplus dairy products.

Additional information on the role of the Commission with regard to dairy production and income stabilization is given in Section 11.2.2.

Producer marketing boards were introduced during the 1930s to give agricultural producers legal authority under certain conditions to control the marketing of their produce. The Natural Products Marketing Act of 1934 attempted to provide this power at the federal level but the courts ruled that the subject was outside federal jurisdiction. The subsequently introduced Natural Products Marketing (British Columbia) Act, 1936 was found to be within the powers of provincial governments and it has since been used as a model for marketing board legislation as it evolved in all ten provinces.

While marketing board legislation has been revised from time to time on the basis of experience and there are variations in detail from province to province, the same basic powers are given to producers in all provinces. These include authority for a duly constituted producer board to control the marketing of 100% of a specified commodity produced in a designated area. A producer board, in at least some provinces, may set production quotas for each farmer. One producer board may control the marketing of several related commodities and the designated area may be either the whole or part of a province. A producer vote is usually required to establish a producer marketing board whose powers are delegated either by a provincial marketing board, which has certain supervisory authority, or by the Lieutenant-Governor in Council.

The powers of a producer marketing board provided by provincial legislation are necessarily limited to trade within the province. Under the Agricultural Products Marketing Act (RSC 1970, c.A-7), the federal government may delegate to a marketing board powers with respect to interprovincial and export trade similar to those it holds under provincial authority with respect to intraprovincial trade. This Act also gives the Governor in Council the right to authorize a provincial marketing board to impose and collect levies from persons engaged in the production and marketing of commodities controlled by it for the purposes of the board, for the creation of reserves and for the equalization of returns.

The federal Farm Products Marketing Agencies Act was passed in January 1972 and is the enabling legislation for the creation of national marketing agencies or boards. National agencies may be set up, when producers and provincial authorities desire it, for any

agricultural commodities which, due to widespread production in Canada or for other reasons, cannot be effectively marketed in an orderly manner under the jurisdiction of individual provincial boards. The Act establishes a National Farm Products Marketing Council to advise the Minister of Agriculture on all matters relating to the establishment and operation of national agencies, to review the performance of and assist in promoting effective marketing by these agencies and to consult with interested provinces on a continuing basis concerning the establishment of national marketing agencies. By late 1972 all provinces but Newfoundland had signed an agreement for the formation of a national egg marketing agency.

During 1971 there were 96 marketing boards in operation in Canada, including the milk control boards mentioned earlier in this Section, and the Canadian Wheat Board which is a federal board. Boards have now been established in all of the provinces, led by Quebec with 26 and Ontario with 22. An estimated 50% of 1971 farm cash income was received from sales made under the jurisdiction of marketing boards. A wide variety of agricultural commodities were sold under marketing boards, including grains, pigs, milk, fruit, potatoes and other vegetables, tobacco, poultry, eggs, wool, soybeans, honey, maple products and wood from farm woodlots. By the end of 1971, 61 provincial boards had been delegated authority by the federal government to control their products in interprovincial and export trade and eight of them had been authorized to collect levies on the commodities marketed under their responsibility.

¹ Includes Newfoundland for all manufactured dairy products.² Includes, in addition to the items listed, malted milk, cream powder, partly skimmed evaporated milk, whole milk powder of less than 26% fat, formula milks, evaporated milk of 2% fat, and concentrated liquid milk.³ Includes, in addition to the items listed, condensed buttermilk, powdered buttermilk, sugar of milk, casein, powdered whey, special formula skim milk products, lactalbumin and concentrated liquid skim milk. Since the quantities used for human consumption and livestock feeding cannot be separated, per capita figures include both.⁴ Includes ice cream mix in terms of milk.

Chapter 12

Mines and minerals

12.1 Canada's mineral industry

12.1.1 Review of the industry

The Canadian mineral industry experienced moderate growth during 1971 after strong growth in 1970. Disturbed world markets forced Canadian producers to add to their inventories for some commodities, while fuels, potash and asbestos expanded both sales and production. Growth of mineral production in 1971 was 4% compared with 21% the previous year.

Canada's mineral production in 1971 was valued at \$5,968 million compared with \$5,722 million in 1970 and \$4,734 million in 1969. Physical volume contributed to the rise in production with an increase in mine output of about 5%. There was strong growth in the fuels sector in 1971.

Canada produces about 60 different minerals from domestic deposits. The ten leading minerals comprised 83% of total output by value in 1971 compared with 82% in 1970 and 79% in 1969. The 1971 value for the ten leading minerals totalled \$4,974 million with individual values at: petroleum, \$1,357 million; nickel, \$800 million; copper, \$760 million; iron ore, \$555 million; zinc, \$418 million; natural gas, \$343 million; asbestos, \$204 million; natural gas by-products, \$193 million; cement, \$191 million; and sand and gravel, \$153 million. The first four accounted for 58% of the total value of mineral production in 1971 compared to 59% in 1970 (Tables 12.1-12.5).

Canada produces nearly all the minerals needed for modern economies. A few items, such as manganese, chromium, bauxite and tin are imported from lower-cost sources. Canada is the world's largest producer of asbestos, nickel, zinc and silver, is second in potash, molybdenum, gypsum and sulphur, and is among the leaders in production of titanium concentrates, platinum, aluminum, gold, copper and iron ore.

The strength of Canada's mineral industry is based largely on export sales. Apparent consumption of domestic minerals is equivalent to proportions of mineral output ranging from 6% for potash and nickel to about 23% for iron ore and about 41% for copper. Minerals and fabricated mineral products exported in 1971 represented 84% of total mineral production value.

Exports of minerals and fabricated mineral products have led several sustained booms in the Canadian economy in the past and they have been a major factor in the recent surge in Canada's export trade. In 1971, these exports were valued at \$5,039 million or 28% of the \$17,744 million total of merchandise exports. This proportion is typical of the past decade or so, but it has been maintained despite the sudden and very large increase in Canada's automobile trade with the United States in the late 1960s. The level of mineral exports was less in 1971 than in 1970 due to weakened United States demand. Shipments to the European Economic Community (EEC) and Britain are significantly lower than formerly. Proportions shipped in 1971 to different markets (with dollar values in parentheses) were: United States, 59% (\$2,989 million); Britain, 12% (\$595 million); Japan, 9% (\$443 million); and EEC, 8% (\$386 million). Comparable percentages for 1970 were: United States, 55%; Britain, 14%; Japan, 8%; and the EEC, 11%. Japan purchased 11% more from Canada in 1971 than in 1970 and the EEC, 31% less.

In 1971, the contribution by value of the various classes of products to the total value of production was as follows (1970 figures in parentheses): fuels 34% (30%); metallics 49% (54%); non-metallics 8% (8%); and structural materials 9% (8%). The slight shift in significance of the classes reflects the relative stability of the demand for domestic structural materials, the continued easing of prices in some non-metallics, the strong growth in exports of fuels and the reduced production of metallics.

Canada leads the world in mineral exports, and ranks immediately behind the United States and the Soviet Union in mineral production. This sector has always been most important in Canada's economic development and is still the main force in the northward advance of Canada's frontiers of population and economic activity.

Prices for minerals presented a mixed picture in 1971. For copper and nickel, which bulk

so large in Canada's exports, prices were historically high but the price for copper dropped late in the year from 53¾ cents per lb. to 50½ cents. In the United States, copper brought 53 cents per lb. but after some fluctuation, ended the year at 50¼ - 50½ cents.

Nickel prices in 1971 were stable in Canada and the United States, at 137½ cents and 133 cents per lb., respectively. Iron ore prices were generally mixed in 1971, Lake Erie base prices advanced by as much as 5% while European prices held mostly at 1970 levels. After several years of increasing prices, the price for ferro-alloys and other additives levelled off in 1971 and in some cases even decreased in a buyer's market. Aluminum prices in Canada were stable at 29½ cents per lb., with the United States' published price at 29 cents, although prices for some contracts were much lower due to the over-supply situation. The price of zinc in Canada and the United States rose from 15 cents per lb. to 17 cents during 1971. Lead and silver prices declined further, lead dropping by 1 cent to 13½ cents per lb. and silver fluctuating from a high of \$1.752 per oz. t. to a low of \$1.288. Among non-metallics, asbestos prices remained stable during 1971. Sulphur prices reached an all-time low of \$7.50 per ton average for the year, while potash prices improved to an average of 37.09 cents per unit K₂O equivalent.

Petroleum (with natural gas), nickel, copper, iron ore and zinc together contribute three quarters of the total Canadian mineral output value and their significance calls for some discussion of their scale of operations, production locations, markets, new sources and prospects.

Petroleum, comprising crude oil and natural gas production and refining, is Canada's largest mineral industry. Domestic production and exports are small in the context of the world's industry but are of very great importance to Canada. This industry's growth in the past two decades has had important effects as a factor in the balance of payments, as a source of revenue to the several levels of government, and as a large component of engineering-construction activity.

In 1971, total petroleum production (crude oil, gas and by-products) was valued at \$1,893 million, an increase of 16% over the 1970 value of \$1,632 million. Crude oil production is concentrated in Alberta, with Saskatchewan in second place and only minor production elsewhere. The pattern of crude oil distribution in Canada reflects the National Oil Policy which allocates markets west of the Ottawa Valley to Canada's mid-continent producers, while Quebec and Maritime markets are supplied by overseas oil. Transportation costs from mid-continent producers to eastern markets are quite significant and the industry is not as

low-cost a producer as is Venezuela or the Middle East. The mid-continent producers have an export market in mid-continent United States which in 1971 almost equalled in volume Canada's imports in the East. Thus, Canada produces oil almost equivalent to the total domestic needs but achieves in domestic markets the lowest-cost supply compatible with balance-of-payments aims. Alberta oilfields are producing much below capacity and the region's economic reserves of oil will last perhaps 20 years at current depletion rates. Canada's North is the focus of much optimism for large-scale oil finds, and exploration continues there.

Natural gas is an important domestic product and a valuable and growing export. Broadly speaking, gas is found where oil is found — mainly in the western provinces and Canada's Arctic. Natural gas production and sales are often reported in volume terms (thousands of standard cubic feet) but to compare, for example, oil and gas output, it is preferable to report equivalent thermal value, or values in dollars which do tend to reflect thermal values. In dollar terms, the gas and gas by-products production of Canada in 1971 was \$536 million, compared with oil output of \$1,357 million; this represents a gas value of about 40% of oil value. In 1970 gas value was \$475 million or 41% of an oil value of \$1,156 million. This trend may continue; for both products, current scale and future growth depend significantly upon access to the United States market. In the case of gas, United States import policy seems focused on prices paid rather than on quantities imported, reflecting the scarcity of gas reserves and supplies within that country.

Canada has large reserves of gas. Western reserves are adequate for about 25 years at Canadian 1971 gross-production rate, and the economics of Arctic transport are at present more favourable for gas than for oil so that the known Arctic gas reservoirs can be viewed with confidence as economically valid reserves. Production in Canada is increasing rapidly with growth of domestic and export markets. Domestic sales volume was 9% above 1970, and comprised 46% of the 1971 net domestic supply; exports, all to the United States, were 17% above 1970.

Gas volumes data give, among other information, gross new production volume, net withdrawals volume, net domestic supply, and total demand. The first is new gas obtained from wells which in 1971 totalled 2,825,000 million standard cubic feet (MMcf); the second was 2,500,000 MMcf after waste, flaring and reinjection deductions; the third was 2,195,000 MMcf after process shrinkage and storage-reservoir inventory adjustments and, with imports in 1971 being insignificant, this net domestic supply is effectively equivalent to total domestic supply and total domestic demand. Domestic sales plus exports fall short of total or net domestic supply by an amount that constitutes change in gas in process, change in pipeline inventory, etc. In 1971, the sum of domestic sales and exports was 1,912,000 MMcf, 13% above the 1970 total. This marketable-production volume of 1,912,000 MMcf is much lower than the gross production total of 2,824,000 MMcf. Pipeline systems linking western and eastern provinces now have ample capacity following major additions in recent years.

Nickel was in second place among Canadian minerals produced in 1971. The year was a difficult one for world nickel producers as an over-supply situation developed. Nickel inventories reached abnormally high levels but prices remained steady throughout the year at 137½ cents per lb. After appreciable mine expansion during 1970, producers announced cutbacks in production for 1971-72 in order to balance supply with demand. Canada maintained its position as the leader in nickel production, accounting for about 41% of total world production, with a value of \$800 million.

Copper was third by value of output among the minerals in 1971. Production of recoverable copper from Canadian mines rose to a new record level of 721,000 tons, an increase of 7% from 673,000 tons in 1970. The international over-supply of copper continued but was not serious because production problems in Zambia and Chile kept output below expected levels. Copper is produced in every province and territory except Prince Edward Island; Ontario dominates output, Quebec and British Columbia together nearly equal Ontario and others are much less significant.

Iron ore production and consumption were both down in 1971 due to decreased demand in Europe, the United States and the domestic market. Production was valued at \$555 million. Of the 33.6 million long tons exported, the United States took 20.1 million (23.8 million in 1970), Britain 4.7 million, western Europe 5.7 million and Japan 3.1 million. Shipments to Japan increased by 41% in 1971, from 2.2 million in 1970. Canada's iron ore industry seems to

have a strong future; immediate plans for expansion include new and enlarged processing facilities. Present Canadian capacity is 47.3 million long tons mine output, with 25.5 million long tons pelletizing capacity. There are four producing provinces: Newfoundland (Labrador), Quebec, Ontario and British Columbia; Newfoundland (Labrador) production dominates while in British Columbia its importance is minor.

Zinc production in 1971 achieved a record value of \$418 million while production (all forms) fell to 1.3 million tons, a decrease of less than 1% from 1970. Canada remained the world's leading mine producer, accounting for 30% of total free-world production.

The value of production of mineral fuels — coal, natural gas, natural gas by-products and crude petroleum — rose to \$2,014 million in 1971. Encouraging changes have occurred in the domestic coal industry during the past two years: application of improved transport and mining techniques has revived the western coal industry and improved prices are increasing revenues. While output and revenues increased nationally, growth was mostly in the West. National output in 1971 was 18 million tons (17 million in 1970) with a value of \$122 million (\$86 million in 1970). Eastern output was down 3%, while western output increased by 13% in 1971. Canada is a net importer of coal; 1971 exports were 8 million tons but imports totalled 18 million tons. Exports should reach more than 15 million tons by 1972 under present contracts, mainly with Japanese iron and steel mills, and a balance in external trade in coal may be in sight.

The volume of mineral production index, which measures the mining industry's absolute growth (1961 = 100), increased 4.6% in 1971 to 186.8 from 178.5 in 1970; the 1960-71 average annual rate of growth was 5.7%. In comparison, the volume index of total industrial production increased 4.0% to 182.6 from 175.5 in 1970 and the average annual rate of growth in the period 1960-71 was 6.3% (Table 12.3).

Investment in new installations, equipment and machinery in Canadian mines, quarries and oil wells (including pipelines) was \$1,700 million in 1971 compared with \$1,350 million in 1970 and \$1,180 million in 1969. The forecast for 1972 was \$1,660 million. Although new capital investment can fluctuate greatly from year to year, repair expenditures which usually rise fairly steadily over time would add a further \$490 million to the 1971 new capital value.

The rapid increase in aggregate investment for the mining sector in the years since 1965 conceals declines of new investment in some activities and differences in experience in different regions of Canada. In metal mining, the annual new capital investment was below \$200 million until 1965 but by 1971 it had exceeded \$800 million. Iron mines investment was relatively limited in 1969 and 1970 but in 1971 it more than quadrupled to \$225 million. Other metal mining investment increased from \$399 million in 1970 to \$554 million in 1971. New capital investment in non-metal mining (excluding oil and gas) was less than \$100 million a year up to 1965 but an investment boom in asbestos, potash and coal brought the annual spending up to \$240 million in both 1968 and 1969. Since then this investment has declined to \$160 million for 1971, with a forecast of \$108 million for 1972.

New capital investment in the petroleum and gas industry (mineral fuels excluding coal) climbed fairly steadily from the \$200-to-\$300 million-a-year rate of the early 1960s, to \$640 million in 1970 and \$733 million in 1971; the 1972 forecast was \$730 million. Within this aggregate there was a shift in emphasis; recently, spending on exploration has increased as new finds have been reported in Canada's frontier areas. This investment is expected to increase substantially in the next few years.

Minerals (excluding oil or gas) investment in individual provinces reflects the regional concentration of mineral resources and the medium-term market prospects for those resources. In the Maritime Provinces, absolute values of investment are small and spending patterns are not clear. In Newfoundland (Labrador) iron mine investment is again heavy after a lull. Quebec investment is at moderate levels with increases in asbestos and iron ore; through the 1960s, Quebec mining investment was uneven but iron ore mining and processing expansions are now taking place. In Ontario, the investment expansion that began in 1965 is still accelerating; iron ore, copper-zinc and nickel-copper spending booms have succeeded one another. In the Prairie Provinces, investment has passed through sharply defined phases in the recent past; at present it is improving. Investment in primary industry in British Columbia was stronger than ever in 1971. Coal, particularly, and metals and asbestos expansions account for the fact that British Columbia mining construction has exceeded even that of Ontario from 1968 to 1971.

In terms of output value of minerals the national scene is dominated by Ontario and Alberta. The significant impact of nickel and oil gave these producers about 54% of the total value of minerals output in 1971; Ontario produced 26% of the total in 1971 as against 28% in 1970. In 1971, Quebec contributed 13% and British Columbia 9%; Saskatchewan, Newfoundland (including Labrador), and Manitoba were in the 5-to-7% range and the contribution of each of the three Maritime Provinces and the two territories was less than 2%. In 1971, Alberta produced 78% of the national fuels value, Ontario 44% of the national metallics value, and Quebec 42% of the national non-metallics value (Tables 12.6-12.8).

Newfoundland (including Labrador). Mineral production value in Newfoundland (including Labrador) in 1971 was \$343 million compared with a 1970 value of \$353 million, a decrease of 3%. In 1971, iron ore output reached 21.9 million tons compared with 23.6 million tons the year before; copper output was 14,000 tons, down from 15,000 tons partly because one mine suffered a five-month strike; asbestos output was 69,000 tons compared with 63,000 tons; the value of fluorspar production decreased to \$2.8 million from \$4.6 million.

Prince Edward Island. Mineral output in this province is confined to structural materials, mainly sand and gravel valued at about \$980,000 in 1971.

Nova Scotia. Total mineral production value in 1971 in Nova Scotia was \$60 million, a level above those of 1969 and 1970 but below the levels of the mid-1960s. Coal output again declined in 1971 to 2 million tons from 2.1 million tons in 1970, as two mines were closed in the province; a new mine at Lingan is scheduled to start producing by 1974. Non-metallic mineral output, apart from coal, was valued at \$21 million, compared with the 1970 value of \$19 million. Output of metallics — lead and silver — fell off sharply from 1970 levels.

New Brunswick. Mineral production value in New Brunswick in 1971 amounted to \$107 million compared with \$105 million in 1970 and \$95 million in 1969, close to 85% of it in metallic ores and products. Although the coal industry has declined in recent years, production rose to 517,000 tons in 1971 due to increased local demand for thermal power generation. Zinc and lead, which comprise one half and one sixth, respectively, of the value of New Brunswick mineral production, are the principal metals. Output of both these metals rose rapidly over the 1968-70 period but less so in 1971; although more lead was produced in 1971 than in 1970, the value was down. Production of zinc, lead, copper and silver is centred around Bathurst.

Quebec. Total mineral output value in Quebec was \$770 million in 1971, an increase over 1969 but a decrease from 1970 values. Metallics constitute more than one half of the annual product, non-metallics one quarter and structural materials one sixth. Fuels production in this province is insignificant.

Metallics produced in Quebec are mainly copper and iron ore and the non-metallic output is almost wholly asbestos. Copper, valued at \$195 million in 1971, accounted for one quarter of all Quebec mineral output and iron ore, at \$111 million, one seventh. Production of both minerals decreased in 1971. Zinc production, at \$58.4 million in 1971, is also a significant contributor to the mineral output of Quebec but tonnage has declined somewhat from 1970. Asbestos production has been fairly stable in output volume since 1968 but revenues were below those of 1970. In Canada, titanium dioxide is produced only in Quebec and is a valuable product with firm world markets; production value increased from \$35 million in 1970 to \$39 million in 1971.

Ontario. Ontario produces minerals valued at more than \$1,500 million annually. Metallics form most of this output and this group shows the greatest recent growth rate although the value was 5% lower in 1971 than in 1970. Nickel is the most important of the metallics, contributing 38% of the province's total value of minerals output in 1971, copper followed with 20%, iron ore with 9% and precious metals with 7%. The range of output is extremely diverse, more so than in any other province of Canada, and the value of metallics produced, not including nickel and copper, is almost as great as the total output value of minerals in Quebec.

Output of fuels in Ontario is relatively small and the non-metallics produced are principally salt, nepheline syenite, asbestos, sulphur and quartz in small quantities. Structural materials produced in 1971 increased in value to \$211 million from \$189 million in 1970.

Manitoba. Manitoba's mineral production in 1971 was valued at \$330 million, a little below the 1970 total. Of the 1971 value, metallic minerals comprised 86%, structural materials 8%,

and fuels 5%. Nickel contributed 74% and copper 21% of the total metallics value of \$284 million.

The rapid rise of mining capacity in Manitoba over the last few years is attributable mainly to recent expansions at the nickel-copper mines of Inco at Thompson. Falconbridge also started its Manibridge mine and mill at Wabowden during the year. However, producers suffered from the world over-supply situation for nickel and 1971 saw substantial additions to inventories and some production cutbacks. Manitoba nickel production in 1971 was 77,000 tons, one quarter of the total Canadian output. Zinc produced in Manitoba was valued at \$8.4 million in 1971, substantially below the level of previous years because of a five-month strike at the Flin Flon and Snow Lake operations of Hudson Bay Mining and Smelting Co., Limited.

Saskatchewan. Saskatchewan's mineral production, of course, reflects the limitations imposed by its geography. In contrast to the more easterly provinces, the Canadian Shield formation comprises much less than one half of Saskatchewan's area, nor does Saskatchewan have the Cordillera and related resources of the more westerly provinces. Saskatchewan, therefore, is mainly a non-metallic minerals producer, supplying principally oil, natural gas and potash; zinc, copper and uranium are of useful but minor annual output value. Oil output is stable, and uranium output continues to decline, but the restoration of order in potash markets through regulation of supply in both Saskatchewan and New Mexico has raised revenues substantially for that product.

The value of total mineral output in Saskatchewan in 1971 was \$409 million, a \$30 million increase over 1970 attributable to price increases in potash and increased petroleum output. The broad picture in the province for the past few years has been one of stable annual value of output. Of the total 1971 output, the fuels class contributed 58%, non-metallics (almost all potash) 36% and metallics about 4%.

Alberta. Alberta is Canada's major oil producer as reflected in the steady increase of its share of the national output which has climbed from 69% in 1967 to 75% in 1971. Production could be even greater since the developed fields are now being operated below capacity. At present production rates, proven economic reserves of oil total about 20 years' supply. Current exploration in Alberta is at a moderate level with new field exploration awaiting the outcome of economic and environmental studies on new sources of oil above the Arctic Circle.

Alberta's total minerals output in 1971 was valued at \$1,640 million of which fuels accounted for \$1,575 million; one third of the remainder was fuel by-product sulphur and two thirds was structural materials – mainly cement, sand and gravel – valued at \$42 million. Crude petroleum production amounted to 372,000,000 bbl, 10% higher than in 1970. Net new production of natural gas in Alberta in 1971 totalled 2,067,000 MMcf compared with 1,870,000 MMcf a year earlier, reflecting continuing strong demand for gas in the mid-continental United States.

Alberta's southwest produces useful amounts of coal, the value of the 1971 output being \$42.4 million compared with about \$28 million in 1970 and \$12 million in 1967 and 1968. The rise in coal production in Alberta is due mainly to increasing demand from Japanese industry.

British Columbia. Total minerals output in British Columbia in 1971 was almost \$544 million compared with \$490 million in 1970 and \$434 million in 1969; the average annual growth in the 1968-71 period was 13%. The range of products is very wide; 57% is provided by metallics, 28% by fuels, 11% by structural materials and 4% by other non-metallics. Copper is especially significant, comprising over one fourth of the total output value of minerals. Other valuable metallics are, in order of importance, zinc, molybdenum, lead, iron ore and silver. Even a little tin is produced, as concentrate, when world prices are high. Non-metallic minerals include asbestos and sulphur; crude oil, natural gas and coal are produced in considerable amounts.

Copper production has climbed rapidly; the 140,000-ton output in 1971 represented a 33% increase over that of 1970; copper revenues were up almost 21%. In 1971, molybdenum production decreased by almost one third in volume as compared with 1970 output levels to 11,000 tons (contained molybdenum basis) of concentrate. The coal mines developed over the past few years recorded a sharp increase in value of production to \$45 million in 1971 as against \$26 million in 1970. British Columbia coal is almost all high-unit-price bituminous coal of coking quality. The enlarged production of 1971, as well as anticipated future expansion, is to meet Japanese requirements.

The rapid growth of mine and mill operations in the province will be given added impetus as a result of the announced policy of the British Columbia government on the smelting of ores. Producers will be expected to process within the province a significant proportion of their mineral output.

Yukon Territory and Northwest Territories. Yukon minerals production comprises metallics — mainly zinc, lead, copper and precious metals — and asbestos. Output is not large by national standards but it is increasing rapidly. In 1971, the \$93 million total output included zinc, \$39 million; lead, \$29 million; copper, \$3 million; silver, \$9 million; and asbestos, \$12 million.

Northwest Territories mineral output, valued at \$116 million in 1971, consists almost wholly of metallic minerals plus a little petroleum and natural gas. Output value was fairly steady in the 1968-70 period, but declined by 14% from 1970 to 1971. Zinc and lead comprised 85% of the output value.

12.1.2 Metals

Nickel. Canada's production of nickel in 1971 amounted to 294,341 tons valued at \$800,064,068, a 4% decrease in both quantity and value from 1970 (Table 12.9). Production was cut back in response to declining world nickel demand and accumulating inventories. The principal Canadian producers, The International Nickel Company of Canada, Limited (Inco) and Falconbridge Nickel Mines Limited, initiated programs during the year to reduce output and defer completion of new and expansion projects. Canada's position as the world's leading producer — 54% of world nickel production in 1971 (excluding the Sino-Soviet bloc) — remained intact but its proportion is declining with the introduction of new production from other countries, mainly the Dominican Republic, New Caledonia, Australia, the Philippines and Botswana.

In Ontario, where 73% of Canada's nickel was produced in 1971, Inco operated 14 mines, five concentrators and two smelters in the Sudbury area and a nickel refinery at Port Colborne. Inco brought three new mines and the 35,000-ton-per-day Clarabelle concentrator into operation during 1971 but suspended production at the Copper Cliff mill, the Creighton concentrator and the Murray mine. The company is developing one new mine in the Sudbury area and one near Shebandowan. The new Inco pressure carbonyl nickel refinery is being prepared for 1973 production. Falconbridge operated eight mines, four concentrators and a smelter, and is developing four new mines. Work on the new mines was deferred in 1971. Texmont Mines Limited began mining ore from its nickel deposit near Timmins in July 1971. Texmont concentrate is being stockpiled. At Werner Lake in northwestern Ontario, Consolidated Canadian Faraday Limited continued production and shipped bulk nickel-copper concentrate to Inco. Noranda Mines Limited is preparing its 700-ton-per-day Langmuir mine, near Timmins, for start-up in 1973.

In Manitoba, where 26% of Canada's nickel was produced in 1971, Inco operated an integrated nickel installation at Thompson for mining, concentrating, smelting and refining. Inco opened two new mines in 1971 but closed the Soab mine. Falconbridge commenced production in 1971 from its 1,000-ton-per-day Manibridge project, a mine and concentrator operation near Wabowden. Sherritt Gordon Mines Limited at Lynn Lake produced nickel concentrate for shipment to the company's refinery at Fort Saskatchewan, Alta. Supplementary feed for the refinery was obtained from Australia and New Caledonia. Dumbarton Mines Limited at Bird River trucked nickel-copper ore to the Faraday concentrator.

One mine produced nickel in Quebec in 1971 — Renzy Mines Limited in Hainault township. In British Columbia, Giant Mascot Mines Limited, near Hope, resumed operations after rebuilding surface facilities which were destroyed by fire in 1970. Giant Mascot ships bulk nickel-copper concentrate to Japan.

Copper. The production of recoverable copper from Canadian mines amounted to 721,430 tons valued at \$760,016,078 in 1971, an increase in volume of 48,713 tons but a decrease in value of \$19,226,325 over 1970 because of lower world prices for copper. Production of refined copper fell to 526,401 tons from 543,071 tons in the same period and consumption declined 16,785 tons to 221,053 tons. Exports of copper in concentrates increased by 45,739 tons to 224,858 tons and exports of refined copper increased by 19,960 tons to 312,363 tons.

Six smelters for the reduction of copper and nickel-copper ores and concentrates were

operated in Canada. In the Sudbury district of Ontario, The International Nickel Company of Canada, Limited (Inco) operated smelters at Copper Cliff and Coniston, and Falconbridge Nickel Mines Limited produced nickel-copper matte at its Falconbridge smelter. Hudson Bay Mining and Smelting Co., Limited at Flin Flon, Man., treated ores and concentrates from its own and other mines in Manitoba and Saskatchewan. Ores and concentrates from most of the copper mines in Ontario, Quebec and Newfoundland were processed at the Noranda smelter of Noranda Mines Limited and the Murdochville smelter of Gaspé Copper Mines, Limited, both in Quebec. Major expansion programs were under way at both the Noranda and Murdochville smelters. Electrolytic copper refineries were operated by Inco at Copper Cliff and by Canadian Copper Refiners Limited, a subsidiary of Noranda Mines, at Montreal East, Que.

Ten new mines producing copper were brought into operation and ten mines were closed during 1971 in Canada; net production capacity was increased by about 40,000 tons of contained copper during the year.

Copper production in Newfoundland in 1971 totalled 13,980 tons valued at \$14,762,654 from four producing mines, one of which closed late in 1971. In New Brunswick copper output increased to 10,266 tons valued at \$10,841,025 from 8,022 tons valued at \$9,313,833 in 1970. In Quebec, production reached 184,823 tons valued at \$195,173,430, compared to 172,640 tons and \$200,443,882 in 1970. About 30 mines were operating during 1971, the main centres of production being at or near Rouyn - Noranda, Val d'Or, Matagami, Chibougamau, Murdochville and Stratford Centre. The Delbridge, Manitou-Barvue and Quemont mines were closed in 1971, while production commenced at the Millenbach mine of Falconbridge Copper Limited.

Copper was produced at a number of mines in Ontario in 1971, the main operations being the nickel-copper mines of the Sudbury district, copper-zinc and copper mines near Timmins, and copper-zinc mines near Manitouwadge. Mine production amounted to 302,370 tons valued at \$317,527,865, an increase of 7,277 tons and a decrease of \$23,311,917 over 1970. One new small mine was opened during the year and two were closed; two mines were being developed for production by the end of 1972. Inco restricted its production of nickel by 22% but the effect on copper production was much less.

Most of Manitoba's 1971 production of 55,264 tons of copper valued at \$58,356,093 came from the mines of Hudson Bay Mining and Smelting Co., Limited at Flin Flon and Snow Lake and, to a lesser extent, from the Lynn Lake mines of Sherritt Gordon Mines Limited. Hudson Bay operated seven mines but operations were shut down by a five-month strike during the first half of the year. Sherritt Gordon production came from its Fox Lake copper-zinc mine and its Lynn Lake nickel-copper mine. Copper concentrates from the Inco mines at Thompson were shipped to Copper Cliff in Ontario for smelting and refining. Copper production in Saskatchewan was from the mine of Anglo-Rouyn Mines Limited near La Ronge and from Hudson Bay's Flexar mine and that portion of the Flin Flon orebody on the Saskatchewan side of the provincial boundary. Production in 1971 was 11,146 tons, 8,327 tons less than in 1970; the value was \$11,769,842, \$10,839,338 less than in 1970.

Production of copper in British Columbia in 1971 amounted to 140,310 tons valued at \$148,130,684, an increase of 34,488 tons and \$25,301,838 over 1970. Two new mines started production in 1971: Utah Mines Ltd., at Coal Harbour on Vancouver Island and Placid Oil Company at Cranbrook. In addition, Giant Mascot Mines Limited brought its new concentrator on stream replacing the one destroyed by fire the previous year. One mine was closed for economic reasons.

Production of copper in the Yukon Territory, all by Whitehorse Copper Mines Ltd., Whitehorse, declined by 5,314 tons in 1971 to 2,566 tons valued at \$2,709,696; production was suspended pending a change in mining methods. In the Northwest Territories copper is obtained as a by-product in the processing of high-grade silver ores.

Iron ore. Iron ore shipments amounted to 43,312,273 tons (42,278,733 dry long tons valued at \$555,135,728) in 1971, down 4,484,112 tons from 1970 when shipments reached an all-time high. [The wet long or gross ton (2,240 lb.) is used here for all shipments of iron ore unless otherwise noted.] Exports were down by 5,083,484 tons to 33,562,557 tons while domestic shipments rose sharply by 599,372 tons to 9,749,716 tons. Production exceeded shipments by 2,346,794 tons and stocks at mines and ports, estimated at 8,400,000 tons at the end of 1970, increased accordingly.

The reduction in exports was mainly a reflection of lower steel production in western Europe and the United States, Canada's largest markets, notwithstanding increased shipments to Japan. Imports were down 764,000 tons to 1,362,000 tons in 1971. A United States iron and steel producer, Jones & Laughlin Steel Corporation, sold the Adams Mine to Dominion Foundries and Steel, Limited in September; this resulted in converting 159,000 tons of potential exports to domestic shipments.

Iron ore consumption was down from 1970 by 769,000 tons to 10,896,000 tons and roughly paralleled the decrease of 470,000 net tons in pig iron production to 8,616,000 tons. However, steel production at 12,170,000 net tons was down only 177,000 tons from the year before. This disproportionate decrease compared to that for pig iron production is attributable to a decrease in the hot metal/scrap iron ratio and an increase in electric furnace steel production using scrap. Blast furnace problems experienced by three Ontario integrated producers rather than lack of demand accounted for the lower pig iron production. Domestic iron ore shipments plus imports exceeded consumption by 215,000 tons and stocks at Canadian iron and steel plants rose accordingly.

Canadian annual iron ore production capacity at the end of 1971 totalled 47,650,000 tons including facilities for 25,330,000 tons of pellet and reduced iron. The industry, which began a period of slow growth in 1969, added only 280,000 tons capacity in 1970 and 300,000 tons in 1971. Closure of Coast Copper Company, Limited's 80,000-ton-per-year iron ore recovery plant on Vancouver Island resulted in a loss of capacity in mid-1970.

The 300,000-ton-per-year reduced iron ore plant of Falconbridge Nickel Mines Limited began tune-up operations in early 1971 but at year-end was still encountering new-process difficulties. In May 1971 Inco announced that because of new pollution abatement requirements, increased construction costs and marketing factors it would cancel the nearly completed 250,000-ton-per-year pellet plant expansion. Furthermore, production of pellets, currently around 670,000 tons per year, well below Inco's rated capacity of 850,000 tons per year, will decrease to some 600,000 tons to meet the new Ontario regulations on sulphur dioxide emissions.

Three major projects in Quebec and Labrador were under construction during 1971: expansion of the Iron Ore Company of Canada's 10,000,000-ton-per-year Labrador City concentrator in Newfoundland (Labrador) and construction of its new 6,000,000-ton-per-year concentrator and pellet plant at Sept-Îles, Que., and Quebec Cartier Mining Company's new 16,000,000-ton-per-year concentrator at Mount Wright, Que.

Production of iron ore, including by-product ore, totalled 45,659,067 tons in 1971 compared with 46,984,342 tons in 1970 and 37,047,527 tons in 1969. Iron ore and by-product ore were produced by 17 companies at 18 locations with ten operations in Ontario, three in British Columbia, two in Quebec, two in Newfoundland (Labrador) and one in Quebec - Labrador.

All provinces except British Columbia reported a decrease in shipments in 1971. Quebec, the second largest producer, recorded the largest loss with shipments of 11,042,000 dry tons, 2,394,000 tons less than in 1970, followed by Newfoundland with 19,533,000 dry tons, down 1,502,000 tons. Ontario shipments were down fractionally by 580,000 dry tons to 9,981,000 tons while British Columbia shipments rose slightly by 46,000 dry tons to 1,723,000 tons.

In Quebec and Labrador, production exceeded shipments, and stocks at the mines and shipping ports were up by 2,300,000 tons. Shipments from Iron Ore Company of Canada, the largest Canadian producer, were down 2,915,000 tons from 1970 and totalled 17,193,000 tons, which consisted of 9,476,000 tons of pellets, 5,922,000 tons of direct-shipping ore (from both Quebec and Labrador) and 1,795,000 tons of concentrate. Canada's second largest producer, Quebec Cartier Mining Company, operated at capacity rate but shipped only 7,864,000 tons compared with 8,870,000 tons in 1970. After completing modifications to its regrind mill from wet to dry, Wabush Mines reached capacity production of 6,100,000 tons for the first time but shipments were only 119,000 tons above the 1970 level of 5,478,000 tons. Hilton Mines, a Quebec producer about 40 miles from Ottawa and the only active Quebec iron mine not on the Labrador Trough, operated at slightly above its rated capacity during the year but shipments at 869,000 tons were fractionally lower than in 1970 when shipments were also made from stockpile.

In the Atikokan area of Ontario, Caland Ore Company Limited closed part and then all of

its operations from about August 15 to October 24 because of very low demand from its United States parent, Inland Steel Company, which takes the entire output. As a result, shipments were down by 672,000 tons to 1,471,000 tons comprising 859,000 tons of pellets and 612,000 tons of Warren Coarse sized ore. The other producer in the Atikokan area, Steep Rock Iron Mines Limited, operated above rated capacity and some 1,416,000 tons of pellets were shipped. For the first time since the mine began production in 1944 no "red ore" or direct-shipping ore was included. Underground mining resumed in 1970 on an experimental basis to tap known resources beneath the open pits and was continued in 1971.

At other Ontario iron mines, operations in 1971 were either at or slightly below capacity production rates. The Adams Mine, purchased on July 31, 1971 by Dominion Foundries and Steel, Limited (Dofasco) from the United States iron and steel producer, Jones & Laughlin Steel Corporation, shipped 1,036,000 tons of which 877,000 tons were exports and 159,000 tons were domestic shipments. This property is operated by Cliffs of Canada Limited, a wholly owned subsidiary of The Cleveland-Cliffs Iron Company, and managing agent of Dofasco's Sherman mine. The acquisition, together with Dofasco's majority interests in the Sherman mine and Wabush Mines, provides the company with its entire requirements of iron ore from Canadian sources. The Griffith mine, which installed fine screening to improve quality and throughput in 1971, shipped some 1,364,000 tons, down fractionally from 1970, while the Sherman mine shipped, all-rail, 1,026,000 tons to Dofasco. Both Marmoraton Mining Company Division of Bethlehem Chile Iron Mines Company and National Steel Corporation of Canada, Limited operated at capacity and shipped 474,000 tons and 681,000 tons, respectively, all to the United States.

The two by-product producers in the Sudbury area of Ontario, The International Nickel Company of Canada, Limited and Falconbridge Nickel Mines Limited, shipped 796,000 tons and 82,000 tons, both up slightly from 1970. Falconbridge's 300,000-ton-per-year reduced iron ore plant began tune-up operations in early 1971, but at year-end was still encountering new-process difficulties.

In British Columbia, both Wesfrob Mines Limited and Texada Mines Ltd. operated at capacity, and 1,255,000 tons and 512,000 tons, respectively, were shipped. With the larger of its two furnaces out of operation during most of the year, Cominco Ltd. consumed only 45,000 tons of iron oxide sinter in the production of pig iron compared with 146,000 tons in 1970.

Exports during 1971 totalled 33,562,557 tons compared with 38,646,041 tons in 1970. The largest market, the United States, took 20,223,000 tons (compared with 23,426,000 tons in 1970) followed by the European Coal and Steel Community with 5,069,000 tons (6,906,000 tons) and Britain with 4,531,000 tons (5,566,000 tons). Shipments to France, which began in 1969, were down slightly from 1970 to 196,000 tons while those to Spain, which became an importer of Canadian iron ore for the first time in 1970, rose sharply from 129,000 tons to 424,000 tons. Exports to Japan were up by 1,047,000 tons to 3,084,000 tons and reflected the increasing importance of Japanese shipments to the eastern producers – Iron Ore Company of Canada and Quebec Cartier Mining Company. The west coast producers, Wesfrob Mines Limited and Texada Mines Ltd., continued to ship all their output to Japan except for a small amount (122,000 tons in 1971) that went to the iron ore reduction plant of Midland-Ross Corp. in Oregon.

The trend toward lower imports accelerated in 1971 as they declined 764,000 tons to 1,362,000 tons, a new low in modern times. The United States provided the bulk of imports in 1971 with 1,272,000 tons all consigned to three integrated iron and steel producers in Ontario. Most of this tonnage went to The Steel Company of Canada, Limited through its 10% interest in The Erie Mining Company, a 10,300,000 ton-per-year pellet producer in Minnesota. Small tonnages of merchant ore are usually shipped to the three producers either for slagging purposes or to cover shortfalls in supply. The Algoma Steel Corporation, Limited has usually been a net exporter of iron ore while Dominion Foundries and Steel, Limited after its purchase of the Adams Mine in 1971 is now self-sufficient. Some 70,000 tons of Brazilian ore went to Sydney Steel Corporation in Nova Scotia but Labrador - Quebec ores have largely supplanted foreign ores in this market.

The level of imports is expected to remain at or below 1,400,000 tons per year until 1974 when a rise to at least 3,000,000 tons is anticipated. The Algoma Steel Corporation, Limited and The Steel Company of Canada, Limited will participate in a joint venture with The Cleveland-Cliffs Iron Company and others in the development of the Tilden mine, a

4,000,000-ton-per-year pellet project near Marquette, Mich. Algoma will take 1,000,000 tons per year, with delivery to begin in 1974, to supply a new blast furnace anticipated to be in operation at that time. Through its joint participation, Stelco will obtain 400,000 tons per year to replace shipments from Hilton Mines where ore reserves are nearing exhaustion.

Lead and zinc. Mine production of lead in 1971 reached a record 405,510 short tons (Table 12.10), 4.2% more than in 1970 and representing about 14.1% of the world total (excluding the Sino-Soviet bloc). Primary refined lead production of 185,555 tons was derived from two plants, one operated by Cominco Ltd. at Trail, BC, where annual capacity is 210,000 tons, and the other operated by East Coast Smelting and Chemical Company Limited, a subsidiary of Brunswick Mining and Smelting Corporation Limited, at Belledune, NB, where annual capacity is 30,000 tons. Exports of lead in ores and concentrates totalled 199,318 tons of contained lead, compared with 165,912 tons in 1970, shipped mainly to Japan, the United States, the Federal Republic of Germany and Belgium. Exports of refined lead amounted to 136,884 tons, 10% less than in 1970, and went mainly to the United States, Britain and India. The price of lead, f.o.b. Toronto and Montreal, increased from 13.5 cents per lb. at the beginning of 1971 to 16.0 cents on April 17, where it remained until October 18 when it dropped to 15 cents for the remainder of the year.

Mine production of zinc in 1971 was 1,249,734 tons (Table 12.11), slightly less than in 1970 and equivalent to over 26% of the world total (excluding the Sino-Soviet bloc). Canada has been the world's largest mine producer of zinc since 1964. In 1971, production of primary refined zinc declined to 410,030 tons from 460,663 tons the year before; output was at 77% of the total rated capacity of Canada's four primary zinc plants. Exports in ores and concentrates, totalling 866,273 tons, went mainly to the United States, Belgium, Japan and the Federal Republic of Germany. Refined zinc exports amounted to 312,227 tons and went mainly to the United States, Britain and India. The domestic producers' price for prime western zinc f.o.b. Toronto and Montreal, increased from 15.0 cents per lb. at the beginning of 1971 to 15.5 cents on April 1 with further increases to 16.0 and 17.0 cents on May 17 and July 27 where it remained for the balance of the year.

Production of lead and zinc in the Yukon Territory continued to increase sharply to 108,000 and 116,000 tons, respectively, as Anvil Mining Corporation Limited operated during the year at full mill capacity of 6,600 tons per day. Production in the Northwest Territories came from Pine Point Mines Limited where the first phase of its underground stope testing program has been completed.

Lead and zinc production in British Columbia was mainly from Cominco Ltd.'s Sullivan mine and 10,000-ton concentrator at Kimberley; the company's Bluebell mine in the Slocan district operated until December when operations were suspended because of exhaustion of ore reserves. It was British Columbia's oldest known lead-zinc mine having been operated intermittently since 1895. Among other lead-zinc producers were Western Mines Limited at Buttle Lake on Vancouver Island; Kam-Kotia - Burkam Joint Venture, Silmonac mines; Reeves MacDonald Mines Limited Annex mine; and Teck Corporation Limited, Beaverdell mine, all in southeastern British Columbia.

Hudson Bay Mining and Smelting Co., Limited recovered lead and zinc from base metal ores of three mines at or near Flin Flon on the Saskatchewan - Manitoba border and five mines near Snow Lake, Man. Sherritt Gordon Mines, Limited continued copper-zinc production at its Fox mine, 30 miles southwest of Lynn Lake, Man. Sherritt Gordon also continued development of its Ruttan copper-zinc deposit in northern Manitoba and planned to bring this open-pit mine into operation in 1973 at a mill rate of 10,000 tons of ore per day.

In Ontario, Ecstall Mining Limited raised the mill capacity of its zinc-copper-lead-silver operation near Timmins to 10,000 tons per day. Ecstall, a subsidiary of Texas Gulf Sulphur Company, remained Canada's largest mine producer of zinc. In 1971 it completed a shaft to 3,050 feet in preparation for underground mining and continued construction of a new electrolytic zinc plant and related facilities which will initially produce about 120,000 tons of refined zinc metal, 230,000 tons of sulphuric acid and 1,000,000 lb. of cadmium metal annually. The plant began operating early in 1972. Other Timmins-district mine producers were Kam-Kotia Mines Limited and Canadian Jamieson Mines Limited. The remainder of Ontario's lead and zinc output came principally from copper-zinc-lead mines at Manitouwadge operated by Noranda Mines Limited, Geco Division, and Willroy Mines

Limited. Selco Mining Corporation Limited, South Bay Division, brought into production its 500-ton-per-day mine and mill at Uchi Lake in the Red Lake district of northwestern Ontario. Mattabi Mines Limited, jointly owned by Mattagami Lake Mines Limited and Abitibi Paper Company Ltd., continued development of its major zinc-copper-silver-lead deposit at Sturgeon Lake, near Sioux Lookout.

In Quebec, relatively small amounts of lead, as well as some zinc, were produced by the Sullivan Mining Group Ltd., at Stratford Centre in the Eastern Townships. Mining companies associated with Noranda Mines Limited accounted for 91% of the zinc output in Quebec, the largest production coming from Mattagami Lake Mines Limited at Matagami. The Millenbach mine of Falconbridge Copper Limited, Lake Dufault Division, Noranda, started operating at its planned rate of 1,100 tons of copper-zinc ore per day in October 1971.

In New Brunswick, the largest zinc-lead producer was Brunswick Mining and Smelting Corporation Limited, which operates mines and a concentrator near Bathurst. Other producers were Heath Steele Mines Limited with a 3,000-ton mill near Newcastle and Nigadoo River Mines Limited operating a 1,000-ton mill in the Bathurst district. The Anaconda Company (Canada) Ltd. suspended production from the copper orebody at its Caribou property near Bathurst because of metallurgical difficulties but continued metallurgical testing and a feasibility study to bring its complex lead-zinc orebody into production. In Newfoundland, both lead and zinc concentrates were produced at the zinc-lead-copper-silver mine of the American Smelting and Refining Company at Buchans.

Gold. Canadian gold production in 1971 was 2,260,730 oz.t. valued at \$79,903,241, a decline in production of 6.1% from 1970 (Table 12.12). The average Royal Canadian Mint price for gold in 1971 was \$35.34 per oz.t., down from \$36.56 in the previous year. In 1971 the Canadian dollar continued to float in the international exchange markets and the value of the Canadian dollar in relation to the United States dollar increased, resulting in a lower Mint gold price. The price of gold on the London gold market varied from a low of US \$37.325 per oz.t. in January to a high of \$43.975 in December.

At the end of 1971, 21 mines were operating. Nine mines closed during the year and one commenced production. All but two of the producing mines received assistance payments on part or all of their production under terms of the Emergency Gold Mining Assistance Act. Because of the increase in the free market price of gold, most of the mines were selling their production on the open market toward the end of the year.

Gold produced from lode gold mines and as a by-product from base metal ores declined in 1971 by 7.1% and 2.4%, respectively. Placer gold production was of minor importance. Lode gold mines accounted for 77.4% of the total output, base metal mines 22.4% and placer mines 0.2%. Ontario was the principal producer, accounting for 50.2% of the total; Quebec and the Northwest Territories accounted for 28.6% and 13.6%, respectively.

Production in Ontario in 1971 declined by 2.4% to 1,133,987 oz.t. from 1,162,042 oz.t. in 1970. Sixteen lode gold mines operated in the province; five closed and one commenced production. Gold recovered as a by-product from base metal ores represented 9.9% of the provincial total. Quebec production declined by 8% to 646,839 oz.t. from 703,015 oz.t. in 1970. Eight lode gold mines operated in the province and three closed. Gold recovered as a by-product from base metal ores was 38.3% of the provincial total.

Gold production in the Northwest Territories in 1971 was from lode mines and amounted to 308,339 oz.t. compared with 332,844 oz.t. in 1970. Gold production in British Columbia was 89,413 oz.t. compared with 101,197 oz.t. in 1970. The only remaining lode gold mine closed. Gold recovered as a by-product from base metal ores accounted for 76% of the provincial total. Placer gold production was small. The combined gold production for Saskatchewan and Manitoba, all as a by-product of base metal ores, was 56,023 oz.t., a decline of 29.6% from 1970. Gold production in the Yukon Territory from placer mining and as a by-product of base metal ores amounted to 14,473 oz.t. Newfoundland and New Brunswick produced a combined total of 11,577 oz.t. as a by-product of base metal processing.

Silver. Canada's mine production of silver in 1971 totalled 46,023,570 oz.t., 1,772,766 oz.t. more than in 1970, to set a new Canadian production record surpassing by over 1,000,000 oz.t. the previous record set in 1968 (Table 12.13). The increase in 1971 came mainly from greater output of several base metal mines producing silver as a by-product, particularly Anvil Mining Corporation Limited which operated at a higher mill rate at its lead-zinc-silver property in the

Yukon Territory. Declines in Newfoundland, Nova Scotia, Ontario and Saskatchewan were more than offset by higher output in the other provinces and the territories. Ontario was again the leading silver-producing province, primarily because of the substantial by-product silver produced at the Kidd Creek base metal mine of Ecstall Mining Limited near Timmins. Base metal ores continued to be the main source of Canadian output, accounting for some 95% of the total. The major portion of the remaining 5% came from silver-cobalt ores mined in northern Ontario and the remainder was by-product recovery from lode and placer gold ores.

Canadian silver production was valued at \$71,796,769 in 1971. The \$10,067,219 reduction from 1970 resulted from lower prices, which fluctuated between \$1.752 and \$1.288 per oz.t. Reported consumption of silver in 1971 was 6,800,000 oz.t. compared with 5,747,068 oz.t. in 1969.

Canadian Copper Refiners Limited at Montreal East, Que., was Canada's largest producer of refined silver, recovering 12,885,000 oz.t. in 1971 from the treatment of anode and blister copper. The silver refinery of Cominco Ltd. at Trail, BC, was the second largest producer, recovering 5,559,823 oz.t. in the processing of silver-bearing lead and zinc ores and concentrates. Other producers of refined silver were The International Nickel Company of Canada, Limited, at Copper Cliff, Ont., from nickel-copper concentrates; and the Royal Canadian Mint at Ottawa, Ont., from gold bullion. At Belledune, NB, East Coast Smelting and Chemical Company Limited recovered by-product silver from lead-zinc concentrates treated in an Imperial Smelting Process blast furnace. Late in 1970, it was decided for economic reasons to close down the Kam-Kotia refinery at Cobalt, beginning April 1, 1971, with final closure date scheduled for February 1972.

The four largest primary sources of silver in Canada in 1971 were: the Kidd Creek zinc-copper-silver mine near Timmins, Ont., operated by Ecstall; the Sullivan lead-zinc-silver mine at Kimberley, BC, operated by Cominco; the silver-lead-zinc mines in the Yukon Territory, about 200 miles north of Whitehorse, operated by United Keno Hill Mines Limited and Anvil Mining Corporation Limited, at Faro, YT. In terms of silver content of concentrates produced, Ecstall recovered 12,768,177 oz.t., Cominco 3,666,522 oz.t., and United Keno 3,007,463 oz.t. Other important mine producers of by-product silver, in declining order of output, included: Noranda Mines Limited, Geco Division, at Manitouwadge, Ont.; Echo Bay Mines Ltd. near Port Radium, NWT; Brunswick Mining and Smelting Corporation Limited near Bathurst, NB; Heath Steele Mines Limited near Newcastle, NB; and Manitou-Barvue Mines Limited at Val d'Or, Que.

Some 2,780,303 oz.t. of silver were derived from silver-cobalt ores mined in the Cobalt-Gowganda area of northern Ontario; the largest producer was again Silverfields Mining Corporation Limited with an output of 1,129,330 oz.t.

Molybdenum. Production of molybdenum in Canada in 1971 was 22,662,732 lb. valued at \$38,367,344 compared with 33,771,716 lb. valued at \$57,140,574 in 1970. Canada was second only to the United States among world producers of molybdenum and supplied approximately 18% of estimated world production (excluding the Sino-Soviet bloc) of 155,400,000 lb.; world mine capacity (excluding the Sino-Soviet bloc) at the end of 1971 was approximately 174,000,000 lb. per year and production in 1971 exceeded consumption by approximately 28,000,000 lb. Capacity is expected to remain in excess of demand for at least five years.

The copper-molybdenum mine, west of Kelowna, BC, of Brenda Mines Ltd. completed its first full production year in 1971. The milling rate was 24,662 tons per day with grade of ore milled being 0.22% copper and 0.062% molybdenum. Recoveries were 89.77% for copper and 86.13% for molybdenum; production for the year was 9,600,000 lb. of molybdenum. Sales in 1971 were 5,100,000 lb. and year-end inventory was 7,600,000 lb. Ore reserves at the end of the year were estimated at 154,000,000 tons averaging 0.182% copper and 0.048% molybdenum.

Endako Mines Ltd. was amalgamated with Placer Development Limited under the name of the latter company in 1971. Production of the Endako Division mine near Endako in central British Columbia was reduced to 75% of the 1970 capacity rate of output in August 1971. The company's accumulation of unsold molybdenum in concentrates was 10,000,000 lb. During 1971 Endako treated 9,051,000 tons of ore at an average grade of 0.162% MoS_2 to produce a total of 14,387,736 lb. of contained molybdenum consisting of 5,163,787 lb. in molybdenite (MoS_2) concentrate and 9,223,949 lb. in molybdic oxide (MoO_3). The Mount Copeland mine of King Resources Company, 18 miles northwest of Revelstoke, BC, produced 969,400 lb. of

molybdenum in concentrate. Noranda Mines Limited, on December 3, 1971, closed the mine of Boss Mountain Division of Brynnor Mines Limited in the Cariboo district of central British Columbia. The closure was due to reduced demand for molybdenum in overseas markets and the large stocks of molybdenum in concentrates already accumulated. Boss Mountain production in 1971 was 2,010,000 lb. of molybdenum in concentrates; ore reserves above the adit level at the end of 1971 were 2,700,000 tons grading 0.25% molybdenum. British Columbia Molybdenum Limited, a subsidiary of Kennecott Copper Corporation, produced 5,100,000 lb. of molybdenum in concentrates. The company's 6,000-ton-per-day mine and concentrator near Alice Arm, operated below capacity due to lack of sales. Utah International Inc. started operation at its Island Copper Mine near Port Hardy on Vancouver Island in October 1971. Design capacity was 33,000 tons per day and annual output was projected at 53,000 tons of copper and 1,900,000 lb. of molybdenum in concentrates. Ore reserves were estimated at 280,000,000 tons averaging 0.52% copper and 0.029% molybdenum.

Lornex Mining Corporation Ltd., managed by Rio Algom Mines Limited, prepared to start production in the first half of 1972 at its large copper-molybdenum property some 33 miles south of Ashcroft in the Highland Valley of British Columbia. The orebody was estimated to contain 293,000,000 tons averaging 0.427% copper and 0.014% molybdenum. Annual production rate was expected to be about 54,000 tons of copper and 3,000,000 lb. of molybdenum. Placer Development Limited continued to develop the property of Gibraltar Mines Ltd., about 35 miles north of Williams Lake in the Cariboo district of British Columbia, for production by mid-1972. The new mine and crushing and concentrating plant have a design capacity of 30,000 tons of ore per day. Ore reserves were estimated at 358,000,000 tons averaging 0.373% copper and 0.016% molybdenite (MoS_2). Several other companies with molybdenum and copper-molybdenum properties in British Columbia examined production possibilities and conducted feasibility studies with a view toward mine financing and development for production.

In eastern Canada, Molybdenite Corporation of Canada Limited continued operation of its mine and concentrator near Lacorne, Que., with provincial government assistance beginning about September 1971. Preissac Molybdenite Mines Limited in the Preissac area, near Cadillac, continued production at a reduced rate for a short period after bankruptcy proceedings were instituted in April. Molybdenum production in eastern Canada, including by-product output at Gaspé Copper Mines, Limited, was 778,003 lb. in 1971.

Uranium. Uranium remained in an over-supply situation in world markets during 1971 as continued overproduction and intense competition combined to force uranium prices to an all-time low. Despite increased sales efforts on the part of Canadian producers, not a single Canadian sale was announced. Not surprisingly, there was a general decline in exploration in Canada during 1971 mainly because of the prevailing poor short-term outlook for uranium and continuing problems respecting foreign ownership of uranium-producing companies in Canada. Of the three Canadian mills operating in 1971 only one was operating at full capacity. A new producer is scheduled to come on stream in 1975.

Denison Mines Limited of Elliot Lake, Ont. began deliveries of uranium in mid-1971 under the new joint-venture stockpiling agreement announced in December 1970 by the federal government. The agreement, to cover the period from 1971 to 1974, will help to assure a stable economy in the Elliot Lake community until major deliveries under Denison's long-term contracts begin in 1975.

Canadian uranium production rose by almost 9% in 1971 to 4,976 tons of U_3O_8 of which 4,107 tons were shipped (Table 12.14). Some 85% of this quantity came from the Elliot Lake area of Ontario with the remainder from the Uranium City area of Saskatchewan. At Elliot Lake, Rio Algom Mines Limited operated its Quirke mill at slightly in excess of its nominal 4,500 ton capacity with most of the total 1,564,000 tons of ore feed coming from the New Quirke mine which opened in 1968. Output from New Quirke has been gradually increased so that by the end of 1971 it was operating at some 6,200 tons a day, well in excess of its original design capacity. Ore reserves at the old Quirke mine were depleted at year-end. Denison's mill, operating at about two thirds of its nominal 6,000-ton-a-day capacity in 1971, treated about 1,387,000 tons of ore. The company continued its program of underground and surface improvements during the year. At Uranium City, Eldorado Nuclear Limited completed the third year of its planned five-year program of reduced production. The 1,800-ton-per-day mill

operated at about 50% capacity, treating a total of 219,391 tons of ore. Operations were suspended temporarily at the Eldorado complex during a strike which lasted from late August to early November.

Eldorado Nuclear Limited, Canada's only producer of refined uranium products, with facilities at Port Hope, Ont., expanded its uranium hexafluoride (UF_6) plant to 2,750 tons of U (in the form of UF_6) in 1971. Eldorado, which is one of five major world refiners, was successful in obtaining new contracts in 1971 for conversion of uranium to UF_6 .

The new uranium project being undertaken by Gulf Minerals Canada Limited at Rabbit Lake, in the Wollaston Lake area of northern Saskatchewan, was in the early stages of pre-production in 1971. This open pit development is expected to be completed by late 1974 with first production early in 1975.

Uranium exploration activity declined further in 1971 and almost no new activity was reported. In eastern Canada, British Newfoundland Exploration Limited (Brinex) continued its efforts in the Makkovik-Kaipokok area of Labrador. Some very minor activity was evident in the Maritimes and also in the Mont-Laurier area of Quebec. Activity in the Elliot Lake - Agnew Lake region of Ontario was significantly reduced. In western Canada, Mokta (Canada) Ltée continued its efforts in the Carswell dome area of northern Saskatchewan and Gulf Minerals carried on with its program along the Wollaston Lake trend. No activity of significance was reported from the Uranium City area of Saskatchewan. Some continued activity was reported in the Northwest Territories, principally in the Baker Lake region and on the Simpson Islands in the eastern arm of Great Slave Lake.

Although the uranium industry suffers in the near-term from over-supply, the long-term outlook remains bright as orders for nuclear generating capacity continue to increase throughout the world. A surge in nuclear plant orders was particularly evident in 1971, notably in the United States but also to a lesser extent in western Europe and Japan. As a result of the increasing number of these nuclear power plants scheduled to come on stream in the future, markets for uranium should develop that will require substantially increased uranium production capacity in Canada by the end of this decade.

Platinum metals. Production of platinum metals in 1971, which amounted to 475,169 oz.t. valued at \$39,821,616, was 7,259 oz.t. and \$3,734,981 less than in 1970. Canadian output is a by-product of nickel refining. When nickel matte is electrolytically refined, the platinoids — platinum, palladium, rhodium, ruthenium, iridium and osmium — are precipitated in the electrolytic tanks as a sludge. The sludge is purified and sent to refineries in Britain and the United States for recovery of the platinum metals. During 1971, major Canadian nickel producers reduced nickel output in an attempt to balance supply with demand with the result that Canadian platinoid production also declined.

About half of the world's output of platinum metals is from the Soviet Union and most of the remainder is produced in Canada and the Republic of South Africa. Platinum has been in short supply throughout the world in recent years but this condition changed to one of over-supply in 1970-71. Potential new end uses for platinum and palladium include catalysts for emission control systems in automobiles. If this market materializes, world demand for these two metals should show renewed growth and world production should increase as well.

Cobalt. Cobalt production in 1971 was 4,323,318 lb. valued at \$9,429,564 compared with 4,561,213 lb. valued at \$10,207,366 in 1970. Canada is one of the world's major cobalt-producing countries, recovering over 95% of its cobalt as a by-product of nickel-copper ores and the remainder from silver-cobalt ores. Approximately 64% of the world (excluding the Soviet bloc) current annual supply of some 24,000 tons is produced, as a by-product of copper recovery, in the Republic of Zaire; the other principal cobalt producing countries are Zambia, Finland and Morocco.

Columbium (niobium) and tantalum. Columbium pentoxide (Cb_2O_5) production in concentrates in 1971 was 2,332,663 lb. valued at \$2,296,962 compared with 4,694,239 lb. valued at \$4,819,951 in 1970. St. Lawrence Columbium and Metals Corporation, with a mine near Oka, Que., is the only Canadian producer of columbium and one of two in the world that produce columbium in pyrochlore concentrates as a primary product; the other is a larger producer with a mine near Araxa in Brazil. St. Lawrence Columbium cut back production early in 1971 because of customers' accumulated stocks of columbium concentrates and ferro-columbium. Production was suspended on June 24 and resumed at less than capacity on

August 9; output was 2,597,667 lb. of Cb_2O_5 during the company's fiscal year ended September 30, 1971 compared with 4,886,957 lb. in the 12 months of the prior fiscal year. Demand for columbium declined in the latter part of 1970 and during 1971. Contract rates for Canadian pyrochlore, f.o.b. mine site, were \$1.15 - \$1.20 per lb. of Cb_2O_5 throughout the year.

Canada's tantalum pentoxide (Ta_2O_5) production in concentrates in 1971 was 449,610 lb. valued at \$2,901,293 compared with 317,024 lb. valued at \$2,251,182 in 1970. Canada's commercial production of tantalum began in 1969 at the Bernic Lake, Man., mine of Tantalum Mining Corporation of Canada, an operating subsidiary of Chemalloy Minerals Limited. This producer was the principal United States supplier in 1970 and 1971, furnishing about 46% of that country's imports; the Republic of Zaïre and Brazil were also major suppliers.

The demand for tantalum declined in 1971 with the temporary recession in the electronics industry. Tantalite ore at the beginning of the year was \$6.75 - \$7.50 per lb. of Ta_2O_5 , 60% basis, c.i.f. US ports, and at year-end the price was \$6.25 - \$6.75 per lb.

Tungsten. Shipments of tungsten in 1971 were 4,624,208 lb. in scheelite (CaWO_4) concentrates compared with 3,726,800 lb. in 1970. Canada Tungsten Mining Corporation Limited produced 2,608,030 lb. of tungsten in concentrates from its mine at Tungsten in the Northwest Territories, about 135 miles north of Watson Lake. Canex Tungsten Division of Placer Development Limited produced 1,364,291 lb. of tungsten in concentrates from its operations near Salmo, east of Trail, in southeastern British Columbia. The 500-ton-per-day capacity Canex mill and concentrator started operation in October 1970.

Cadmium. Cadmium output in 1971, expressed as the sum of refined metal and the recoverable cadmium content of exported zinc concentrates, was 4,063,805 lb. valued at \$7,883,782; corresponding figures for 1970 were 4,307,953 lb. and \$15,336,313. The decrease of almost 49% in value of output was due to much lower prices prevailing in 1971. Cadmium is recovered as a by-product during the smelting and refining of zinc ores and concentrates. Most of the zinc ores in Canada carry minor quantities of the metal, varying from 0.001 to 0.067% of recoverable cadmium, and zinc concentrates contain up to 0.7% cadmium. The largest mine production comes from the Kidd Creek mine near Timmins, Ont., followed by Pine Point Mines Limited in the Northwest Territories, Cominco Ltd. in British Columbia, Hudson Bay Mining and Smelting Co., Limited in Saskatchewan and Manitoba, and the Noranda group of companies in Ontario, Quebec and New Brunswick. Refined cadmium is produced at the electrolytic plants of Cominco at Trail, BC, Hudson Bay Mining and Smelting at Flin Flon, Man., and Canadian Electrolytic Zinc Limited at Valleyfield, Que. Brunswick Mining and Smelting Corporation Limited, which also recovered cadmium, converted its ISF smelter into a lead blast furnace late in 1971 and from that time exported all its cadmium-bearing zinc concentrates for treatment at foreign smelters.

Selenium and tellurium. The value of the 719,000 lb. of selenium produced in 1971 was \$6,531,000, slightly higher than in 1970. Tellurium output decreased sharply to 24,000 lb. valued at \$148,000. These metals are recovered from the anode muds resulting from electrolytic refining of copper anodes at the plants of Canadian Copper Refiners Limited at Montreal East, Que., and The International Nickel Company of Canada, Limited at Copper Cliff, Ont.

Magnesium. The only Canadian producer of primary magnesium is Chromasco Corporation Limited (formerly Dominion Magnesium Limited). Its mine and smelter are at Haley, Ont.; smelting capacity is 12,000 tons annually. Production in 1971 was 7,234 tons, valued at \$5,163,921 and has been declining since 1969 when 10,485 tons were produced. Exports of magnesium metal fell drastically, being only 2,917 tons in 1971 compared with 7,669 tons in 1970. Imports in 1971 were 1,827 tons. Canadian consumption rose to 6,276 tons in 1971 from 4,937 tons the previous year. Total world production in 1971 was estimated at 253,700 tons.

12.1.3 Industrial minerals

Asbestos. In 1971, 1,634,579 tons of asbestos were produced in Canada, 27,065 tons less than in 1970. The value of output decreased about 2% to \$203,999,244, compared with an approximate increase of 9% in the previous year (Table 12.15). Quebec accounts for about 82% of the Canadian production and Newfoundland, Ontario, British Columbia and the Yukon Territory for the remainder. Most of the Canadian production was exported as milled fibre and shorts, providing about 60% of total world exports and about 40% of total world

production. The United States, Britain, Japan and the Federal Republic of Germany together absorbed about 62% of the exports from Canada.

The world outlook for asbestos consumption is favourable and emphasis continues to be placed on the completion of new Canadian projects. In Quebec near Deception Bay, Ungava, development continued at the Asbestos Hill property owned by Asbestos Corporation Limited. An annual output of about 300,000 tons of ungraded fibre will be shipped to Nordenham, West Germany. Asbestos Corporation continued development of the Penhale orebody adjacent to the Normandie mine at Black Lake. Canadian Johns-Manville Company, Limited proceeded with a relocation and reconstruction program that will maintain annual output at a minimum of 600,000 tons of fibre. Carey-Canadian Mines Ltd., East Broughton, was involved with plant expansion that will raise mill capacity from 4,500 to 5,500 tons per day. Bell Asbestos Mines, Ltd., Thetford Mines, continued work on a long-range modernization program. Abitibi Asbestos Mining Company Limited arranged senior financing and management agreements with Brinco Limited to manage a pilot-plant study at the asbestos property situated in Maizerets Township, 50 miles north of Amos. McAdam Mining Corporation Limited arranged with Rio Tinto Canadian Exploration Limited to further evaluate its property. In Ontario, Allied Mining Corporation continued evaluation of its property situated 43 miles south of Timmins.

In British Columbia, Cassiar Asbestos Corporation Limited completed expansion of its mill, which now has a capacity of 120,000 tons of fibre per year. At the Clinton Creek mine, Yukon Territory, additional mill equipment was installed to increase output eventually to about 120,000 tons of fibre per year. Newfoundland's sole producer, Advocate Mines Limited, increased production by about 10% in 1971. Ontario's asbestos production increased in 1971 by about 13% as a result of the combined increase in output from the Reeves mine of Johns-Manville Mining and Trading Limited and from the Matheson mine of Hedman Mines Limited.

Potash. Canada's potash industry is centred in Saskatchewan where production started in 1962 and development was so rapid that in 1971 there were ten mines in operation with a combined annual production capacity of 13,680,000 tons of potassium chloride (KCl) (Table 12.16). Canada has the world's largest production capacity but this rapid development, coupled with a downturn in fertilizer sales, has resulted in a world over-supply of potash. Canada consumes only about 7% of its production, the remainder being exported, principally to the United States.

The world over-supply of potash created serious marketing problems in 1969. In an attempt to at least partly rationalize the market and to prevent mine closures, Saskatchewan promulgated the Potash Conservation Regulations, effective January 1, 1970. Under the regulations, production at each mine is allocated according to plant capacity to meet total market requirements; the industry's operating rate in 1971 averaged 47.8% of capacity. Prices were also regulated under the provincial regulations at not less than 33.75 cents (Cdn.) per unit of K₂O equivalent.

Salt. Salt production in Canada in 1971 totalled 5,541,901 tons (Table 12.17), about two thirds being mined rock salt primarily for snow and ice control on streets and highways and for chemical manufacture, and the remainder fine vacuum salt and salt as brine for use in producing caustic soda and chlorine. There are three rock salt mines, one in Nova Scotia and two in southwestern Ontario; fine salt evaporator plants and brining operations are located in Nova Scotia, Ontario, Manitoba, Saskatchewan and Alberta. Most of British Columbia's salt needs are met by imports of solar salt from Mexico and the San Francisco Bay area.

Sulphur. Canadian production of elemental sulphur in 1971 was 3,149,280 tons valued at \$21,299,520 (Table 12.18); sulphur production in all forms, including sulphur recovered from smelter gases and contained in pyrites, amounted to 3,895,000 tons valued at \$27,063,000. Most of the sulphur produced is extracted as elemental sulphur from sour natural gas in western Canada. Canada is the world's largest producer of sulphur from hydrocarbon sources and is the world's largest exporter. Exports in 1971 decreased 15% below 1970 to 2,647,893 tons. Because of world over-supply and an extremely competitive market situation, the downward trend in prices which began in early 1969 continued throughout 1971, reaching an all-time low of \$5.47 and an average for the year of \$7.22 a ton. Value of elemental sulphur exports decreased accordingly some 30% to \$27,132,000.

For the fourth consecutive year, world producers' stockpiles continued to build up as a result of increased output (notably in Canada and Poland) and reduced consumption especially in the fertilizer industry which uses about 50% of the sulphur marketed. Although recovery of the fertilizer industry in particular and the world economy in general is anticipated during 1972 and 1973, increasing involuntary production of sulphur from such sources as sour natural gas and industrial pollution abatement will have an adverse effect on the restoration of equilibrium within the present decade.

Gypsum. Gypsum production in Canada in 1971 was 6,702,100 tons (Table 12.19). Output in general increased from the previous year, reflecting conditions in the building construction industry in Canada and the United States. Over 70% of Canada's gypsum output is exported to the United States, most of it from Nova Scotia quarries, which account for about 73% of total Canadian production of crude gypsum. The prospects are for increased production in 1972 in support of greater building activity in Canada and the US.

Nepheline syenite. Nepheline syenite was first produced in 1936 and, until recently when Norway started production, remained a uniquely Canadian mineral commodity. "Nepheline syenite" is a rock name that applies to a mixture of minerals, essentially the feldspars and nepheline. The presence of nepheline provides the mixture with a higher content of alumina (Al_2O_3) than has either soda or potash feldspar and makes nepheline syenite more desirable than feldspar in certain applications, especially in the manufacture of glass, for which about 75% of the output is used. However, markets for finely ground material, used in the manufacture of whitewares such as bathroom fixtures, china, ovenware, electrical porcelain and ceramic artware, are growing rapidly. Very finely ground material is being increasingly used as a filler material in plastics, foam rubber and paints. Low-grade material is sold in bulk for use in the manufacture of fibreglass and for glazing on brick and tile.

Production originates from two mines in Canada, both located in Ontario on Blue Mountain, some 25 miles northeast of Peterborough. The deposit is pear-shaped, approximately five miles in length and up to one and a half miles in width. Reserves are very large. In 1971, production, at 517,190 tons, increased marginally from the 486,667 tons produced in 1970 and the value of production correspondingly increased to \$6,206,014 from \$5,801,228 (Table 12.20). Some 80% is exported, most of it going to the United States for use in glass manufacture. In 1971, there was a 5% increase in exports to 404,240 tons valued at \$5,229,000.

Structural materials. The value of all construction undertaken in Canada in 1971 was estimated to be \$15,647,000,000, and that of the production of structural materials, including cement, sand and gravel, stone, clay products and lime, was estimated at \$512,478,366. As a group, structural materials represented about 8.6% of the total value of all mineral production in 1971.

Approximately 9,067,000 tons of cement were produced in Canada in 1971, surpassing the peak output and value attained in 1966 (Table 12.21). Cement is produced in all provinces except Prince Edward Island but nearly 68% of the total 1971 production came from Ontario and Quebec. Total productive capacity of the industry in 1971 was 14,729,000 tons per year, including a new plant at Kamloops, BC. An additional plant, capable of producing up to 1,100,000 tons per year, is under construction at Bath, Ont. for Canada Cement Lafarge Ltd. The company is also expanding its facilities at St. Constant, Que., Havelock, NB and Exshaw, Alta.

Sand and gravel are used principally as aggregates in concrete for building and engineering construction and as fill in road construction. Gravel in boulder sizes is used for riprap and armour-stone construction; other over-sized material is crushed to provide various-sized ranges. Lithologically, sand and gravel deposits are usually composed of material similar to the rock types in which the deposits are found; infrequently, deposits are composed of materials that have been transported some distance from their origin. Exploitation of these low-unit-value materials is greatly influenced by the physical characteristics of the sand or gravel, by the location of the deposit with respect to suitable markets, by the specifications established to differentiate quality products and, more recently, by land use and rehabilitation regulations. (See Table 12.22.)

The stone industry includes those companies producing dimension stone, ornamental stone, crushed stone, whiting, and stone for metallurgical and chemical use. Dimension stone

products account for less than 1% of the total volume of stone production and about 10% of the total value. Crushed stone products, consisting of materials used for concrete aggregate, railway ballast, road metal, rubble and riprap, terrazzo, stucco and artificial stone, etc., account for about 80% of the total volume; the remainder is used in the chemical and allied industries. (See Table 12.23.)

Common clays and shales occur in most regions of Canada and are the principal raw materials used for brick and tile manufacture. Deposits of high-quality argillaceous materials used in the manufacture of such products as papers, refractories, high-quality whitewares and stoneware products are relatively scarce in Canada. Consequently, china clay (kaolin), fire clay, ball clay, and stoneware clay are mostly imported. The final production value of clay products from domestic clays increased marginally to \$51,791,258 in 1970 and decreased to \$48,583,262 in 1971 (Table 12.24).

The table refers to production of such products as brick and tile made from domestic clays. Imports of these products, mainly from the United States, have a low total value. Other clay products such as floor and wall tile, sanitary ware, pottery and dinnerware, and electrical porcelain contain a large proportion of china clay and ball clay. The value of whiteware products produced in Canada from such materials approached \$34,000,000 in 1970.

12.1.4 Petroleum and natural gas

Further indications of the anticipated large oil and gas potential in Canada's frontier areas were given in 1971 by the first significant oil and gas discovery in the east coast off-shore areas and additional discoveries in the Canadian North. Particularly noteworthy were the oil and gas discoveries made on Richards Island in the Mackenzie Delta, the gas discovery at Kristoffer Bay on the west coast of Ellef Ringnes Island, and the oil and gas discovery on Sable Island off the Nova Scotia coast. On the basis of preliminary estimates it would appear that many of these are major discoveries and could be major supply sources in the future. However, until these new-found reserves are connected to market by pipeline, Canadian domestic and export requirements will continue to be met from the producing areas of western Canada where natural gas reserves showed only a modest increase in 1971 and reserves of petroleum and natural gas liquids actually declined. Substantial additions to reserves will be needed if Canada is to meet its own increasing demand and to continue to increase exports of oil and gas to United States markets.

Continuing strong demand for Canadian oil and gas in United States markets contributed significantly to Canadian production gains in 1971 (Tables 12.25 and 12.26). Total production of all liquid hydrocarbons — crude oil plus natural gas liquids — increased by almost 7.1% to 1,585,000 barrels per day (b/d). Net production of crude oil averaged 1,348,000 b/d and field and gas plant production of natural gas liquids reached 237,000 b/d. Alberta production at 1,015,000 bbl, accounted for 75.5% of the total Canadian crude oil output, 2.3% more than in 1970. Production remained static in all producing provinces and territories except Alberta, where there was a 10% increase.

Total liquid hydrocarbon reserves declined to 10,162,000,000 bbl, comprising 8,333,000,000 bbl of crude oil and 1,829,000,000 bbl of natural gas liquids. Reserves added in 1971 totalled 288,000,000 bbl and of this amount, 207,000,000 bbl were attributed to revisions, 63,000,000 bbl to extensions of established fields, and 18,000,000 bbl to new discoveries. Since production was 564,000,000 bbl in 1971, total proven reserves showed a net decline of 276,000,000 bbl for the year. Fully 90% of Canada's proven liquid hydrocarbon reserves at the end of 1971 was in Alberta. Proven remaining marketable natural gas reserves rose by 3.9% to 55,461,850 MMcf in 1971, representing an improvement over the 2.7% increase attained in 1970. Net withdrawals of natural gas rose 9.1% to 6,847 MMcf/d in 1971 in response to increasing demand in both domestic and export markets.

Alberta. Although the number of well completions rose by 9% in 1971, the footage drilled showed only a slight increase. This resulted from a continuation of the recent trend to drill a larger number of wells in southern Alberta where potential producing reservoirs occur at relatively shallow depths. Much of this shallow drilling activity was related to the development of gas reserves in the Medicine Hat - Alderson area of eastern Alberta. However, during 1971, a medium-gravity oil discovery was made in the Grand Forks area of southern Alberta which promises to develop into one of the best fields found in Alberta in recent years. Exploratory

and development activity was spread throughout many areas of the province, and a significant new gas-bearing trend was outlined in the Dunvegan - Belloy area north of Grande Prairie in west-central Alberta.

Interest in Alberta's Athabasca tar sands is increasing because of a tightening world crude oil supply situation and the prospect of higher crude oil prices. Alberta's only recovery plant, which is operated by Great Canadian Oil Sands Limited at Fort McMurray, averaged 42,000 b/d during 1971. Syncrude Canada Ltd. received approval to raise the capacity of its proposed plant in the Fort McMurray area to 125,000 b/d of synthetic crude oil and 5,500 b/d of residual fuel oil. It is scheduled for completion in 1976. Experimental projects were also started to evaluate thermal methods for the in situ recovery of oil from the Athabasca tar sands and the extensive heavy oil deposits in the Cold Lake area of east-central Alberta.

A total of 1,990 wells were drilled, an increase of 166 over 1970. Development footage increased by 8% to 3,585,434 ft while exploratory footage declined 3% to 4,300,181 ft.

Saskatchewan. Drilling activity continued to decline in Saskatchewan as exploratory drilling decreased 3% to 1,053,283 ft and development drilling declined 32% to 954,226 ft. Nevertheless, interest in natural gas remained high as gas well completions rose substantially, mainly from development drilling in west-central and southwestern Saskatchewan, particularly around the Hatton field. Most of the oil development drilling continued to be in the heavy oil area around Lloydminster and in the medium-gravity oil fields of southwestern Saskatchewan.

British Columbia. Total footage drilled in British Columbia increased by 6% to 950,295 ft because of small increases in both exploratory and development drilling. A promising dual zone gas discovery was reported at the Home et al. Attachie 7-29 site located 25 miles northeast of Fort St. John. Other potential gas discoveries were reported along the Devonian Slave Point trend near the northern British Columbia boundary. Development drilling continued around existing oil fields in the Fort St. John area but no new producing trends were discovered.

Manitoba. Industry activity in the province continued to decline for lack of new discoveries. Total footage drilled dropped to 32,428 feet in 1971 from 54,726 feet in 1970. Oil well development drilling was confined to the margins of existing fields. There is no gas production in Manitoba.

Yukon Territory, Northwest Territories and Arctic Islands. The pace of exploratory effort in the territories and the Arctic Islands quickened during 1971 and was rewarded by several significant oil and gas discoveries. In the Mackenzie Delta area, Imperial Oil Limited's exploration program has so far yielded two oil finds on the Tuktoyaktuk Peninsula and two gas-condensate strikes on Richards Island in the Mackenzie Delta. Two of these discoveries were made in 1971. Early in 1972, Imperial Oil made another significant gas discovery on Richards Island, nine miles northeast of the gas discovery they had made in the previous year. Drilling in the area is being accelerated to more fully evaluate its reserve potential and will include the first experimental use of man-made islands for drilling platforms in the shallow delta waters.

In the Arctic Islands, Panarctic Oils Ltd. continued to dominate the exploration picture and was rewarded by another natural gas discovery at Kristoffer Bay on Ellef Ringnes Island. This is the third natural gas discovery made by Panarctic in the Arctic Islands since it began its exploratory program four years ago. The two previous discoveries, the first on Melville Island in 1969 and the second late in 1970 on King Christian Island, are considered to be major fields. Early in 1972, Panarctic made the first oil discovery in the Arctic Islands on the Fosheim Peninsula of Ellesmere Island. Although this find was not commercial, it does point up a potential for oil in the Sverdrup Basin. Total drilling, all exploratory, increased in 1971 to 76 wells (468,016 feet) from 70 wells (361,710 ft) in 1970.

Eastern Canada. The most significant discovery to date in the exploration of eastern Canadian off-shore areas was made in 1971 on Sable Island, approximately 190 miles east-southeast of Halifax, NS. The discovery tested substantial amounts of oil, gas and condensate from 17 different productive zones. Follow-up drilling to this discovery was scheduled for 1972 to determine if commercial production can be established. Since 1968, 30 exploratory wells have been drilled off the east coast of Nova Scotia, several of which had non-commercial indications of oil and gas.

Elsewhere in the eastern off-shore, the first exploratory well ever to be drilled on the Labrador Shelf had to be suspended before it reached total depth because of poor weather and rough sea conditions. This test was located about 510 miles north and slightly west of St. John's, Nfld.

In Ontario there were no significant discoveries made in 1971 and both exploratory and development drilling declined. Exploratory drilling, at 135,000 ft, was down 8% from the previous year and development footage, at 116,000 ft, declined 28%.

12.1.5 Coal

Canadian production for 1971 was 18,400,000 tons, an increase of 11.0% over the previous year (Table 12.27). Alberta's subbituminous production, representing 24.0% of the total, accounted for much of this increase by expanding 12.9% over 1970, largely to meet the greater needs of the electric utilities. Consumption of coal by electric utilities in 1971 increased 8.8% to 17,200,000 tons from 15,200,000 tons the previous year. Japanese demand for metallurgical coal was the outstanding reason for the increase of bituminous production by 25.2% and 33.1% in Alberta and British Columbia, respectively, so that bituminous coal ultimately represented 58.1% of total production despite a decrease of 7.4% in Nova Scotia. Saskatchewan's lignite production dropped 13.6% over the previous year, yet again representing 17.9% of total production.

Exports of coal for 1971 increased 76.1% over 1970 to 7,700,000 tons, of which 96% was shipped to Japan. Landed imports during the same period decreased 7.9% to 18,100,000 tons, of which approximately 95% entered through Ontario ports (Table 12.28). United States bituminous coal, of which 9,000,000 tons was used in thermal power generation and 7,000,000 tons in steel plants, accounted for 90% of these imports (Table 12.29).

Value of production (f.o.b. mines, and including value of reclaimed coal) increased 41.4% over 1970 to \$122,000,000 for 1971. For bituminous coal, unit value of production was \$9.92 per ton in British Columbia (an increase of \$2.54 per ton over 1970), \$9.85 per ton in Alberta (an increase of \$2.24 per ton), \$11.71 per ton in Nova Scotia (an increase of \$1.42 per ton) and \$7.61 per ton in New Brunswick (an increase of \$0.12 per ton). Alberta subbituminous averaged \$1.60 per ton (a decrease of \$0.03 per ton) while Saskatchewan lignite decreased \$0.01 per ton to \$1.93.

British Columbia. In 1971 production of low- and medium-volatile bituminous coals increased by more than one third to reach some 4,600,000 tons as production increased from the large mining complex of Kaiser Resources Ltd. in the Crowsnest Pass area of southeastern British Columbia. After experiencing difficulties with its large surface mine and preparation plant in 1970, Kaiser began a program of modifications in 1971 to overcome these problems. As a result Kaiser renegotiated interim adjustments in its long-term contract with Japanese buyers. Shipments were curtailed for three weeks in December 1971 as a result of a fire in Kaiser's coal dryer.

During 1971 Fording Coal Limited continued pre-production developments at its coal mine located along the Elk River, 35 miles north of the Kaiser mine. A 34-mile spurline from the CPR mainline was completed into the property in October. By late 1971 construction of its surface coal mine was almost completed. Initial deliveries under Fording's long-term contract with Japanese steel companies were scheduled to commence on April 1, 1972.

In 1971 a number of companies continued exploration programs for coal, particularly in northeastern British Columbia. In the southeastern part of the province, two properties were the object of feasibility studies.

Alberta. Alberta is Canada's leading coal-producing province, producing subbituminous and bituminous coals. Subbituminous output is used almost entirely for generation of electricity while the bituminous production is principally for the export market in Japan. In 1971 total production rose by approximately 18% to 8,000,000 tons as bituminous production increased by roughly one quarter.

Of the two new bituminous mines which commenced production of coking coal for export to Japan in 1970 only Cardinal River Coals, Ltd., situated in the Luscar area, operated at full capacity in 1971. McIntyre Porcupine Mines Limited, operating a large coal mining complex 80 miles northwest of Luscar in the Smoky River valley, experienced operating difficulties in 1971, particularly with their underground longwall system which was abandoned in mid-year

for a room-and-pillar system. Difficulties were also being experienced at McIntyre's preparation plant. By year-end a small surface mine had been developed to supplement underground production.

Subbituminous production continued to expand during 1971 because of the growing demand for coal for mine-mouth power generating stations in Alberta. Production rose by almost 13% in 1971. Substantial expansion is planned at the Highvale mine in the Wabamun area to service additional units at the Sundance generating station. In addition, two mines in the Forestburg area are increasing capacity to meet the planned expansion of the nearby Battle River generating station.

Exploration for both bituminous and subbituminous coals remained quite active in 1971. One company completed a feasibility study on a bituminous coking coal property near Luscar.

Saskatchewan. Production of lignite coals from the Estevan area of southeastern Saskatchewan declined by some 14% in 1971 from the record year of 3,800,000 tons in 1970. This decline happened mainly because the large purchases made by Ontario Hydro in 1970 to overcome shortages in that year were not repeated in 1971. Saskatchewan lignite is used primarily for the generation of electricity in Saskatchewan and to a lesser extent in Manitoba. The large Boundary Dam generating station at Estevan is the main consumer of lignite.

Yukon Territory. In 1971 small amounts of coal were produced at Carmacks for the lead-zinc operation of Anvil Mining Corporation Limited at Vangorda Creek.

New Brunswick. Coal production rose by roughly 30% to over 500,000 tons in 1971, primarily from increased demands in the province for thermal generation of electricity. The provincially-owned corporation, N B Coal Limited, which operates all coal mines in the province, continued its program of consolidation by closing the last underground mine in 1971. All coal production is now being extracted by surface methods. In recent years the only coal mining operations in New Brunswick have been conducted in the Minto coal field.

Nova Scotia. In 1971 coal production declined slightly to about 2,000,000 tons. The largest producer, Cape Breton Development Corporation (DEVCO), closed one mine in 1971 and continued development of its new mine at Langan scheduled for opening in 1974. Besides DEVCO, one mine closed at Springhill and another was scheduled to close at Thorburn early in 1972. Chief markets for Nova Scotia coal are thermal power generation and coke making.

Future outlook. Major export market possibilities exist, in addition to the already substantial demand from Japan, for Canadian metallurgical coal. The ability of the western Canadian coal mining industry to meet production schedules and quality standards and successful development of inexpensive methods for transporting coal from mines to consumers are critical to the rate of future export growth. Canadian coal production can reasonably be expected to double by 1980 to meet an increasing demand within the country and for export.

12.2 Government aid to the mineral industry

12.2.1 Federal government aid

Federal assistance to the mining industry takes the form of the provision of detailed geological, geophysical, topographical, geodetic, geographical and marine data which are of basic importance to the discovery and development of the mineral resources of Canada; the provision, through laboratory and pilot-plant research, of technical information concerning the processing of ores, industrial minerals and fuels on a commercial scale; certain tax incentives; and financial and technical assistance to the gold-mining industry under the Emergency Gold Mining Assistance Act.

The Department of Energy, Mines and Resources. The federal Department of Energy, Mines and Resources was created by the Government Organization Act on October 1, 1966 (RSC 1970, c.E-6). Apart from its administrative establishments, the Department is made up of three Sectors - Science and Technology, Mineral Development and Energy Development - each headed by an Assistant Deputy Minister and each aiding the Canadian mineral industry according to its assigned responsibility.

The Science and Technology Sector contains the Mines Branch, the Geological Survey of Canada, the Surveys and Mapping Branch, the Earth Physics Branch, the Atlantic Geosciences Centre, the Polar Continental Shelf Project and the Canada Centre for Remote Sensing.

The Mines Branch is a large laboratory and pilot-plant complex carrying out applied and

basic research to discover new and better methods of ensuring mine safety, extracting and refining ores and other minerals, and using metals and minerals in industry and defence. Gratifying results are being achieved in the extraction of metals from ores and in the refining of low-grade crude oil, in the automation of grinding circuits and cyanide leaching processes in gold mills and in the leaching of ground or crushed uranium ores by bacteria. An example of work that has resulted in direct economic benefit has been the development of a process to produce metallurgical coke from western Canadian coal, making it possible to undertake a long-term contract to export coke to Japan. In pyrometallurgy – the extraction of metals by heat – applied research is concentrated principally on the combination of shaft and electric furnaces for smelting iron ore. In petroleum refining, research concerns hydrogenation, catalytic cracking and catalyst development. This work is highly significant because of the opening up of unconventional sources such as the Athabasca tar sands and the so-called Colorado oil shales, whose economic importance has been recognized by the Mines Branch for many years. A close tie-in with producers is maintained in mineral processing in which the emphasis is on the concentration of metallic ores and on the processing and improvement of industrial minerals. In the field of mineral sciences, the physical, chemical, crystallographic and magnetic studies being undertaken on sulphide minerals are of fundamental interest. In physical metallurgy, experiments on new alloy combinations continue to yield valuable practical benefits for Canadian industry.

The Mines Branch is assisted in its work by the National Advisory Committee on Mining and Metallurgical Research, comprising senior executives and researchers from industry, government and universities.

The Geological Survey of Canada maps and studies the geology of Canada. It is the major organization engaged in this work in Canada and its studies extend to all provinces and territories. Its activities are designed to support two programs of the federal Department of Energy, Mines and Resources, the Mineral and Energy Resource Program and the Earth Science Program. A principal aim of the former is to ascertain the mineral and energy resource potential available to Canada and thus the Survey expends considerable effort in such fields as estimating the potential abundance and probable distribution of mineral and fuel resources. This is done by providing the necessary systematic geological framework, by defining those settings favourable to the occurrence of the various types of mineral commodities and fuels and by comparing these by appraising foreign mineral and fuel resources and by other studies. The Earth Science Program includes activities designed to assist in effective use and conservation of resources and in the management and preservation of man's environment throughout Canada. To assist in this, the Geological Survey provides geologically based information on land resources and terrain performance which is derived from geological, geomorphic, geophysical, geotechnical and related studies of earth and rock materials, land forms and associated dynamic processes.

In support of these activities, the Survey each year sends about 100 parties into various parts of Canada. The results of its studies are published in memoirs, bulletins, papers, maps and numerous scientific technical journals. Headquarters is in Ottawa but there are several regional offices of which the Institute of Sedimentary and Petroleum Geology in Calgary and the Atlantic Geosciences Centre at Dartmouth are the largest.

The Atlantic Geosciences Centre is located in the Bedford Institute at Dartmouth, NS. Its geologists and geophysicists study and investigate the deep structure of the continental shelves and the floors of the open ocean. The importance of this work can be seen in the light of the rapidly increasing interest in the potential mineral resources of continental shelves and of the world ocean. EMR scientists also study material from off-shore wells drilled by industry. Information gained from wells, when integrated with that from marine geological and geophysical surveys, provides the geological framework from which (a) the oil and gas potential may be estimated and (b) geological conditions evaluated to permit the regulation and supervision necessary to attain orderly and safe exploration of off-shore fuel resources. Because of the surge in exploration for petroleum in eastern Canada's sedimentary basins and the Gulf of St. Lawrence, EMR's geological and geophysical research is of great interest and value to the petroleum industry.

The Earth Physics Branch carries out much geophysical work of interest to the mineral industry. It studies, collects and publishes, in the form of maps and charts, information on the geomagnetic field in Canada. Most of the information published is obtained from airborne

geomagnetic surveys, which have ranged over the whole of Canada and across the Atlantic to Scandinavia. In addition, the Branch maintains a network of ten permanent geomagnetic observatories, as well as temporary observatories in summer at many widely distributed sites. It also operates a network of 23 seismic stations to assist in the study of the earth's interior and to obtain data for its quantitative assessment of seismic risk throughout Canada. In gravity research, another means of studying the composition of the earth's crust, the Branch is systematically mapping variations in the earth's gravity on a regional basis throughout Canada, including the Arctic and the floors of the Gulf of St. Lawrence and Hudson Bay. The results of all gravity measurements to the end of 1966 are available in a new gravity map of Canada on a scale of 1:5,000,000 or about 80 miles to the inch, for easy comparison with the new geological and tectonic maps of Canada on a similar scale.

No mineral development is possible without accurate, large-scale topographical maps. The Surveys and Mapping Branch, in conjunction with the Mapping and Charting Establishment of the Department of National Defence, has completed the topographical mapping of the country at the medium scale of 1:250,000, or about four miles to the inch. About 40% of the larger-scale mapping at 1:50,000 has been completed in the more settled areas and areas of greater economic importance.

The Mineral Development Sector is composed of the Mineral Resources Branch and the Explosives Division. The Explosives Division is responsible for the administration of the federal Explosives Act which is primarily an Act of public safety to control the manufacture, authorization, storage, sale, importation and transportation by road of explosives.

The Mineral Resources Branch is responsible for resource-economic research, program development and policy formulation in the field of non-renewable resources. It conducts fundamental and applied resource-engineering-economic research and field investigations into non-renewable resource problems, policies and programs on a commodity or total industry basis, in a regional, national and international context. The work covers all aspects of the mineral industry from resources through exploration, development, production, processing, transportation and consumption. On the basis of this work, the Branch publishes resource-engineering-economic reports and advises government departments and agencies on non-renewable resource policy matters. Current activities include regional studies of the mineral economy of a number of areas in Canada; assessment of mineral projects in various parts of Canada for which federal support has been requested; mineral resource and mineral reserve studies in a number of mineral commodities, including the mineral fuels, uranium and coal; and the safeguarding of Canadian mineral interests through participation in international agencies such as the United Nations Lead-Zinc Study Group, the Economic Commission for Europe, the Committee on Natural Resources on the Economic and Social Council, and the International Tin Council. The Branch administers the Emergency Gold Mining Assistance Act as a means of aiding mining communities largely dependent upon the gold mines. In collaboration with the Canadian International Development Agency and with the support of industry, the Branch is setting up training courses for mineral scientists, technologists and economists brought to Canada under the various aid programs, and is advising on mineral projects undertaken by Canada as an aid to developing countries. The Branch publishes an extensive series of reports and other material, and maintains the Mineral Occurrence Index, which is a listing of about 14,000 mineral showings and deposits in Canada that may be consulted by anyone interested.

The Energy Development Sector is discussed in more detail in Chapter 13, Section 13.1.1, but because of the wide range of interests of this primarily policy-making group and the direct impact of some of its activities on the mining industry, some specific areas of assistance are considered here. The Sector studies and assesses individual projects and developments relative to each of the energy sources and in terms of interrelationships with other energy sources. It appraises trends in oil and gas exploration and production, transportation, processing and marketing in Canada and on an international scale, and provides information to federal government agencies, industry and the general public on oil and gas developments in Canada and abroad. In the field of uranium, the Sector continues to co-ordinate uranium matters on such subjects as stockpile programs, possibilities of the establishment of uranium-enrichment facilities in Canada and export opportunities. With respect to coal, in addition to its wider role it provides assistance in the form of research and development grants to help improve the quality and utilization of coal, and provides advice on production expansion rates compatible

with profitability and projected demand in Canadian and foreign markets. The Sector also administers and manages the federal interests in mineral resources off-shore from Canada's east and west coasts and in the Hudson Bay region, as well as federally owned mineral rights in the provinces that become available for disposition.

Tax incentives to the mineral industry. Although mineral industry enterprises are subject to federal income tax, there are certain benefits granted to such enterprises under the Income Tax Act which serve as incentives to exploration and development of minerals, and to further processing of minerals. Certain modifications were made in the tax incentives to the mineral industry in the amended Income Tax Act which became effective on January 1, 1972.

Under the provisions of the amended Act, the exemption from income tax for the first three years of operation of new mining ventures will terminate at the end of 1973. However, initial capital expenditures in a new mining operation on buildings, machinery and equipment, and certain community and transportation facilities may be deducted as rapidly as income will permit. Consequently, new mining ventures will not be liable for federal income tax until these initial capital expenditures have been recovered. In the case of a major expansion of an existing mine, capital expenditures on buildings and on machinery and equipment also may be deducted immediately.

The operators of oil or gas wells or mines have been able to claim, during the full life of the operation, an automatic depletion allowance equal to one third of the taxable income. In general, the effect of the automatic percentage depletion allowance is to reduce the tax otherwise payable by one third. The automatic percentage depletion allowance will continue to apply until the end of 1976. Beginning in 1977, the automatic percentage depletion allowance will be replaced by an earned depletion allowance. The rate at which the earned depletion allowance may be deducted annually will remain at one third of the taxable income. However, the total amount of the allowance which may be deducted will be limited to the base or pool which is earned through eligible expenditures. The depletion base will amount to \$1 for every \$3 of expenditures on exploration and development activities, on certain assets acquired for a new mine or major expansion, and on facilities acquired to process, up to the prime metal stage, ores which were previously exported from Canadian mineral resources. Depletion may be earned on eligible expenditures between November 7, 1969 and the end of 1976 and accumulated for deduction after 1976.

Mining and petroleum companies will continue to have the right to claim costs of exploration and development incurred in the search for oil, gas or minerals in Canada as an immediate deduction from income from all sources. The cost of mineral properties will be classified as exploration expenses and immediately deductible. The cost of mineral properties will not earn depletion. Revenue from the sale of mineral properties will be treated as income.

Prospectors and their financial backers are no longer exempt from income tax on receipts from the sale of a mining property, but receipts in the form of shares will be classified as a capital gain upon sale of the shares. Only one half of a capital gain is subject to income tax. The tax liability of the prospector upon the sale of the shares may be further reduced through purchase of a forward-averaging annuity contract. Prospectors may deduct exploration costs, at the rate of 20% annually, from other income.

The general corporate tax rate which was 50% in 1972 will be reduced by one percentage point each year until it reaches 46% in 1976. The federal government abates to the provinces ten points of the corporate tax rate. Beginning in 1977, the abatement to the provinces in the case of mining companies will be increased by 15 percentage points, reducing the federal corporate tax rate on mining companies to 21%. At that time, the provinces will be in a position to occupy 25 percentage points of the corporate income tax rate on mines.

In the budget of May 8, 1972, the Minister of Finance proposed a reduction in the general corporate tax rate for manufacturing and processing to 40%, together with a two-year write-off on machinery, equipment and buildings. These benefits would apply to the processing of minerals only beyond the prime metal stage. It was also proposed that custom processors of minerals not owning a mineral resource would be eligible for the automatic depletion allowance as from January 1, 1973 and would be eligible to earn depletion for deduction after 1976 through expenditures on processing machinery and equipment acquired after 1972. The budget proposals were not enacted during the last session of Parliament, but the government indicated an intention to introduce enabling legislation in 1973.

Emergency Gold Mining Assistance Act. Under this Act, which came into force in 1948 (RSC 1970, c.E-5), financial assistance is provided to marginal gold mines to counteract the effects of increasing costs of production and a fixed price for gold. By enabling gold mines to extend their productive life, the subventions help communities dependent on gold mining to adjust gradually to diminishing support. In 1971, the Act was amended and its application extended to June 30, 1973 (RSC 1970, c.7, 2nd Supp.).

An Interdepartmental Committee on Gold Mining, in a Memorandum to Cabinet in April 1972, recommended that the EGMA Act be extended for a further three years from June 30, 1973 to June 30, 1976 without any change in the present method of computing the amount of assistance payable. This was confirmed by the Cabinet on May 23, 1972 and the Minister of Energy, Mines and Resources announced that a Bill would be introduced in Parliament to amend the EGMA Act accordingly.

The amount of assistance payable to an operator is determined by a formula, and is based on the average cost of production per ounce and the number of ounces produced; it ranges from zero to \$10.27 per oz.t. produced. Gold mines having a cost of production of \$26.50 or less per oz.t. receive no assistance and those having a cost of production of \$45 or more per oz.t. receive the maximum rate of \$10.27 per oz.t.

Under the current formula, the assistance payable to the operator of a gold mine is computed by adding 25% to the product of two factors — the “rate of assistance” and the number of “assistance ounces”. The number of assistance ounces is two thirds of the total ounces produced and sold to the Royal Canadian Mint by a mine in a calendar year. The rate-of-assistance factor is two thirds of the amount by which the average cost of production exceeds \$26.50. The rate-of-assistance factor is limited to a maximum of \$12.33 which is reached when the average cost of production rises to \$45 per oz.t. of gold produced. The average cost of production is determined by dividing the total allowable costs by the total number of ounces produced in the form of bullion from the mine in a calendar year. Only those ounces of gold that have been sold to the Royal Canadian Mint are eligible for inclusion in the assistance-ounces factor. The cost of production includes mining, milling, smelting, refining, transportation and administration costs. Allowances are made for depreciation, pre-production costs and expenditures on exploration and development on the mine property in accordance with the Regulations.

The amounts paid to operators of gold mines to March 31, 1972 for the years 1948-71 inclusive, totalled \$301,270,630 on a production of 61,738,601 oz.t. of gold produced and sold in accordance with requirements of the Act. The assistance payable for gold produced and sold under the Act in the calendar year 1971 was estimated to be \$11.8 million. The average Mint price for gold in Canadian funds was \$37.69 in 1969, \$36.56 in 1970 and only \$35.34 in 1971.

In March 1968, the governors of the central banks of seven nations introduced a two-price system for gold which separated transactions in gold among the central banks from private open-market operations. The governors agreed that the existing official reserves would be used only in transfers among monetary authorities at the established price of US\$35 per oz.t., and that the central banks would neither purchase nor sell gold in private gold markets. The Minister of Finance stated that Canada would support fully the agreements reached by the central bankers. He also stated that there would be no change in the practices applicable to gold producers under the Emergency Gold Mining Assistance Act.

Operators of gold mines were thus offered the alternatives of selling their production to the Royal Canadian Mint at the fixed price of \$35 per oz.t. in United States funds in order to qualify for assistance payments under the Emergency Gold Mining Assistance Act or of selling on the open market at the price determined by supply and demand. It may be noted that the amount of assistance payable is determined on the basis of the cost of production and is not related to the selling price of the gold.

In accordance with the agreement by the central bankers, gold purchased by the Mint is not added to Canada's official reserves, but is sold on the open market. Except for a short period early in 1970, the open market gold price exceeded US\$35 from April 1968 to the end of 1971. Since only gold mine operators receiving cost assistance sold their gold to the Mint, the cost of assistance under the Act was effectively reduced by the difference in price at which the Mint bought newly mined gold and the price for which it was sold to open market bidders during this period.

On May 27, 1968, the price per fine troy ounce of gold paid by the Mint was set at US\$35 by the Gold Bullion Regulations (Order in Council PC 1968-1017). This price prevailed until Order in Council PC 1972-560, dated March 23, 1972, authorized the Royal Canadian Mint to raise the Mint price to US\$38 on such date as the Minister of Finance might specify. On May 8, 1972 the United States gold price was officially raised to \$38 per oz.t. Effective the same date, the Minister of Finance authorized the Royal Canadian Mint to raise the Mint paying price to US\$38 per oz.t.

During 1971 the gold price continued to rise in international open markets and was close to US\$44 by the end of the year. Several lode gold mines decided to forego any cost assistance under the EGMA Act and commenced selling their gold on the open market during 1971. The price of gold on open markets continued to advance during 1972 and Canadian lode gold mines are now selling all their gold production on the open market and are receiving no cost assistance under the EGMA Act.

12.2.2 Provincial government aid

Newfoundland. The Newfoundland government, through the Mines Branch of the Department of Mines and Energy, provides several valuable services to those interested or involved in exploration and mining, including: a continuing program of mineral assessment designed to encourage development of the mineral resources of the province; inspection of exploration work carried out on concession areas and examination of mining operations; administration of beaches (control of removal of sand and gravel as a conservation measure) and collection of data relevant to the control of sand removal; identification of mineral rock specimens submitted by the public and examination of corresponding occurrences where warranted; technical advice dispensed to those who seek such service (i.e., in hydrological problems and on the availability of quarriable peat moss to be removed by permit); co-operation with the Geological Survey of Canada and other federal government agencies; and preparation and publication of data useful for educational and general informational purposes, including the preparation of mineral and rock sample sets. Geological reports, geophysical maps and compilations of general data pertaining to specific areas are procurable at nominal cost and other information from unclassified files is made available to interested parties. Prospectors' or miners' permits are issued by the Mines Branch and mining claims are recorded.

Nova Scotia. Under the provisions of the Mines Act (RSNS 1967, c.185), the government of Nova Scotia may assist a mining company or operator in the sinking of shafts, slopes, deeps and winzes and the driving of adits, tunnels, crosscuts, raises and levels. This assistance may take the form of work performed under contract, the payment of bills for materials and labour, or the guarantee of bank loans. Any such work must be approved by the Department of Mines. Mining machinery and equipment to be used in searching for or testing and mining of minerals may be made available through the government. Such equipment is under the direct supervision of the Chief Mining Engineer.

The government of Nova Scotia is also empowered to make any regulations considered necessary for increasing the output of coal. Such regulations cover appropriation, on payment, of unworked coal lands, operation of coal mines, and loans or guarantees for loans. Close co-operation is maintained with the federal government in carrying out federal regulations made to secure increased production and economical distribution of coal from the mines of the province.

New Brunswick. The Mineral Development Branch administers the disposition of Crown mineral rights including the issuing of prospecting licences, recording of mining claims, issuing of mining licences and leases and other matters pertaining thereto. Detailed and index claim maps are prepared for distribution. The Branch is responsible for general and detailed geological mapping and investigations. Maps and reports are prepared for distribution, mineral and rock specimens are examined for prospectors and preliminary examinations of mineral prospects are made when requested and circumstances warrant. The Branch administers the safety regulations governing operations under the Mining Act. All mines are regularly inspected, laboratory facilities are maintained and certain equipment used in mines must be approved. The Branch is responsible also for the collection of mining taxes and royalties and the preparation of statistics on mineral production. A regional office, located at

Bathurst and staffed by geologists and inspectors, serves as a recording office for northeastern New Brunswick, and another at St. George, staffed by a senior geologist, conducts regional work and assists exploration companies and prospectors working in the southwestern area. Claim maps and topographical, geological and aeromagnetic maps are available for perusal and distribution.

Quebec. Through its Director General of Mines, the Department of Natural Resources is responsible for implementing the Mining Act (SQ 1965, c.34) and the Mining Duties Act (SQ 1965, c.35). The directorate includes the following three branches: Geology, Mines, and Mining Economics and Development. The Geology Branch consists of six services: geological exploration; mineral deposits; geotechnology; technical documentation; mapping; and technical revision. The Branch is responsible for the geological study of the province with the aim of promoting development of its mineral resources. As a result of field trips undertaken each year, the Branch is in a position to supply detailed reports on various areas, together with geoscientific maps. The new geotechnical service is concerned with solving problems connected with development of a particular environment through application of its geological knowledge of the area.

The Mines Branch includes the Mine Titles Service, Inspection and Engineering Service and the Mining Conflicts Division. The Branch controls awards of mining rights on Crown lands. Its work covers registration of mining claims and issuing of development permits or special permits governing the sale or rental of lands for mining purposes. Further, it sees to it that holders of mining rights carry out whatever development work is specified in the titles they hold. Mine inspectors ensure that work done in mines, quarries and treatment plants is carried out in conformity with the safety measures prescribed by law or regulation. The Mines Branch is also responsible for preparing and carrying out whatever engineering works are required to open up new mining areas or operations, including the building of access roads, construction of mining townsites and for any regulations pertaining to the use of the land in question. The Mining Conflicts Division is responsible for verifying the existence or validity of claims in accordance with Part VI of the Mining Act.

The Mining Economics and Development Branch is concerned with the optimum use of Quebec's mineral resources through development and conservation. Three services are now being organized: Plans, Economic Evaluation and Publicity. The Branch aims to identify and make plans for projects that lend themselves to quick and concrete results in the development of Quebec's mineral resources. It will carry out, or have carried out, studies on marketing, financing, transportation, development and operational techniques, profitability and other essential aspects of various undertakings.

To provide for future development of the mining industry, scholarships are granted to students wishing to become engineers in the fields of geology, mining and metallurgy. Scholarships are also awarded to students in hydrology or related sciences (hydro-electricity, hydraulics, and meteorology). The Department of Natural Resources, in co-operation with the universities, gives annual courses for prospectors. Finally, the Department makes a conscious effort to initiate students at the secondary and CEGEP levels by seconding staff members to camps for young scientists to interest them in the mineralogy and geology fields.

Ontario. The objective of the Mines Division of the Ontario Ministry of Natural Resources is to provide an optimum continuous contribution to the economy of Ontario by stimulating and regulating the utilization of available supplies of minerals by resource products industries. The Mines Division is composed of four Branches in Head Office: the Mineral Resources Branch, the Geological Branch, the Mines Engineering Branch and the Mineral Research Branch.

The objective of the Mineral Resources Branch is to ensure the orderly development and utilization of provincial non-renewable resources. It is essentially a strategic planning group composed of four sections: Industrial Minerals (including the administration of the Pits and Quarries Control Act), Metallic Minerals, Petroleum Resources and Commodity Analysis.

The Geological Branch's objectives are to encourage an optimum level of exploration activity and rate of mineral discovery through geological, geophysical and geochemical surveys of the province, the publication of maps and reports on mineral occurrences in Ontario and the education of prospectors and others in mineral exploration. Assessment work files are administered by this Branch. It is also responsible for the administration of the Mineral Exploration Assistance Program, a program designed to stimulate exploration in the Red

Lake, Geraldton - Beardmore, Kirkland Lake and Cobalt areas. One third of the cost of exploration to a maximum of \$33,000 is provided to junior- and medium-sized companies to explore in these areas.

The Mineral Research Branch is composed of the Assay Laboratory in Toronto and the Temiskaming Testing Laboratory in Cobalt. The Assay Laboratory provides assay and analytical services and conducts mineralogical investigations to aid in the discovery and development of mineral deposits. Its services are available to the mining industry and public at large. The Temiskaming Testing Laboratory situated at Cobalt operates a bulk sampling and assay laboratory to assist the producers of the area in marketing their silver-cobalt ores.

The Mines Engineering Branch administers Part IX of The Mining Act which calls for regular examination of all operating mines, quarries, sand and gravel pits and certain metallurgical works with a view to ensuring the health and safety of employees as well as the public. Regional geologists and mines engineers provide advice or support to the line organization of the Ministry. The Lands Administration and Surveys and Mapping branches of the Lands Division handle matters dealing with the recording of mining claims, assessment work, etc. and the preparation of title to mining lands.

Manitoba. The Mines Branch of the Manitoba Department of Mines, Resources and Environmental Management offers the following services: recording the staking and acquisition of Crown mineral rights and other relative material associated with minerals, compiling assessment information and inspecting mineral rights dispositions; compiling geological data pertinent to mineral occurrences, issuing reports and maps covering geological and geochemical surveys, operating an analytical and assay laboratory to assist prospectors and geologists in the evaluation of mineral occurrences and the classification of rocks and minerals; giving engineering approval of mining works and inspecting mining operations regarding the health and safety of employees, controlling in-plant environmental and safety regulations related to mining and quarrying operations, training mine rescue crews and inspecting mine rescue facilities; inspecting oil well drilling sites, abandonment and reworking and maintaining records of each operation.

The Mineral Exploration Assistance Act (1966) provides for limited financial grants to prospectors who have carried out previously approved exploration programs at specified locations; such grants are repayable if the program leads to a profitable mining operation.

Saskatchewan. The Mineral Lands Branch of the Department of Mineral Resources is responsible for the disposition of all Crown minerals and maintains records respecting areas let out by lease, permit, drilling reservation, claim or claim block. Recording offices, located at Regina, La Ronge, Uranium City and Creighton, assist the public in determining the lands available and accept applications.

Officers of the Mines Inspection Branch, under the authority of The Mines Regulation Act, make regular examinations of all mines to ensure proper conditions for the health and safety of the men employed. Safety education, particularly in the form of first aid and mine rescue instruction, is also a part of the work of this Branch. All Branch officers are stationed at the Regina headquarters.

The Precambrian Geology Division of the Geological Sciences Branch conducts geological surveys in the Shield areas of the province and publishes maps and reports for the information and guidance of the industry. Resident geologists are stationed at Uranium City and La Ronge and at the latter centre a laboratory provides for storage and examination of core and samples. The Division processes exploration data and assessment work to be made available for inspection by the industry.

Alberta. The Energy Resources Conservation Act, proclaimed January 1, 1972, provided for the transfer to the Energy Resources Conservation Board of responsibility for the administration of The Pipe Line Act, The Coal Mines Regulation Act and The Quarries Regulation Act. This transfer brings under one administrative authority all aspects of the energy resources of Alberta including their conservation, regulation and transmission. The Board regulates coal mines and quarries and maintains standards of safety by inspection and certification of workers. The oil and gas industries are served in a similar way but regulatory measures are also concerned with preventing the waste of oil and gas resources and with giving each owner of oil and gas rights the opportunity of obtaining a fair share of production. The Board compiles periodic reports and annual records which are of invaluable assistance in oil

development in Alberta. The Workmen's Compensation Board also maintains safety standards and pays the cost of training mine rescue crews. The mining industry is also served by the Research Council of Alberta which has made geological surveys of most of the province and has carried out projects concerned with the uses and development of minerals. The Council has studied the occurrence, uses and analyses of Alberta coals and their particular chemical and physical properties, the use of coals in the generation of power, and the upgrading and cleaning of coal; and has also studied briquetting, blending, abrasion loss, shatter and crushing strength, asphalt binders and dust-proofing of coal. Studies have been made of glass sands, salt, fertilizers, cement manufacture and brick and tile manufacture.

The province from time to time has had commissions examine various aspects of the mining industry when it has considered that their findings would be of assistance in developing such industries. The province, together with the Canadian Association of Oil Well Drilling Contractors and the Canadian Petroleum Association, maintains a detailed supervisory and safety training program concerned with the drilling of oil and gas wells. Of assistance also to mining companies and oil companies are the special reductions provided for in the Alberta Income Tax Act. These follow the parallel provisions in the federal Income Tax Act.

British Columbia. The Department of Mines and Petroleum Resources of British Columbia provides the following services: detailed geological mapping as a supplement to the work of the Geological Survey of Canada; assistance to the prospector in the field by departmental engineers and geologists; grub-stakes, limited to a maximum of \$800, for prospectors; assistance in the construction of mining roads and trails; and inspection of mines to ensure safe operating conditions.

12.3 Mining and petroleum legislation

12.3.1 Federal and departmental jurisdictions

Mineral rights vested in the Crown in right of Canada include those situated in the Yukon and Northwest Territories and off-shore underlying Canada's continental margins, as well as those underlying certain federally owned lands within the provinces.

The Supreme Court of Canada in its Opinion of November 1967 stated that, as between Canada and the province of British Columbia, Canada has proprietary rights in and legislative jurisdiction over "lands, including the mineral and other natural resources, of the sea bed and subsoil seaward from the ordinary low-water mark on the coast of the mainland and the several islands of British Columbia, outside the harbours, bays, estuaries and other similar inland waters, to the outer limit of the territorial sea of Canada, as defined in the Territorial Sea and Fishing Zones Act...". The Court also stated that the federal government has legislative jurisdiction "in respect of the mineral and other natural resources of the sea bed and subsoil beyond that part of the territorial sea of Canada... to a depth of 200 metres or, beyond that limit, to where the depth of the superjacent waters admits of the exploitation of the mineral and other natural resources of the said areas...".

The Department of Energy, Mines and Resources, through the Resource Management and Conservation Branch, is responsible for administration and enforcement of legislation and regulations relating to mineral resources off-shore from Canada's east and west coasts and in the Hudson Bay and Hudson Strait regions, as well as with respect to federally owned mineral rights in the provinces mentioned above. The Department of Indian Affairs and Northern Development, through the Northern Economic Development Branch, is similarly responsible for mineral rights in the Yukon and Northwest Territories and underlying Canada's high-Arctic off-shore regions.

Mineral rights of Indian reserves in the provinces are also vested in the Crown in the right of Canada and are administered by the Indian-Eskimo Economic Development Branch of the Department of Indian Affairs and Northern Development. The rights to a reserve may be taken up only after the Indian band has given approval for development through a referendum vote. The minerals are then administered under the Indian Oil and Gas Regulations or the Indian Mining Regulations, except in British Columbia where mining rights must be acquired under provincial statutes and the BC Indian Reserves Mineral Resources Agreement of 1943. The Indian Oil and Gas Regulations provide for disposal of rights by public tender in the form of permit or lease parcels. The Indian Mining Regulations, on the other hand, provide for disposal based on terms negotiated with the Indian band council. The Indian councils are thus

assuming a greater share of responsibility in the management of their mineral resources. Officers of the Department of Indian Affairs and Northern Development are advisers to the Indian councils on mineral matters and are responsible for the administration and enforcement of relevant regulations.

12.3.2 Federal mining laws and regulations

Mining exploration is carried out in the Yukon Territory in accordance with the provisions of the Yukon Quartz Mining Act and the Yukon Placer Mining Act; in the Northwest Territories, including Arctic coastal waters, operations are governed by the Canada Mining Regulations 1961, as amended. There are also the Territorial Dredging Regulations, Territorial Coal Regulations and Territorial Quarrying Regulations common to both territories. In the Yukon Territory, mining rights may be acquired by staking claims under the appropriate Acts and Regulations. A one-year lease may be obtained to prospect for the purposes of placer mining, renewable for two additional periods of one year each; a 21-year lease, renewable for a like period, may be obtained under the Yukon Quartz Mining Act.

Under the Canada Mining Regulations, a prospector's licence is required. Staked claims must be converted to lease or relinquished within ten years. In certain areas, a system of exploration by permit over large areas is allowed. Any individual over 18 years of age or any joint-stock company incorporated or licensed to do business in Canada may hold a prospector's licence. No lease will be granted to an individual unless the Minister of the Department involved is satisfied that the applicant is a Canadian citizen and will be the beneficial owner of any interest acquired under such lease; no lease will be granted to a corporation unless such corporation is incorporated in Canada and unless the Minister is satisfied that at least 50% of the issued shares of the corporation are owned by Canadian citizens or that the shares of the corporation are listed on a recognized Canadian stock exchange and that Canadians will have the opportunity of participating in the financing and ownership of the corporation. Any new mine beginning production after the Canada Mining Regulations came into force in 1961 will not be required to pay royalties for 36 months, starting from the day the mine comes into production. Production date is established as the date determined under the provisions of the Income Tax Act.

An exploration assistance fund for petroleum and other minerals in the Yukon and Northwest Territories was established by the federal government in 1966. Initially limited to \$3,000,000 a year, the fund may provide 40% of the cost of approved exploration programs. Assistance is available only to Canadian citizens or companies incorporated in Canada. Named the Northern Mineral Exploration Program, it is designed to encourage investment from additional Canadian sources previously not attracted to investment in northern exploration operations.

12.3.3 Oil and gas legislation

Oil and gas exploration and development in the Yukon and Northwest Territories and Canadian off-shore areas are governed by the Territorial Lands Act, the Public Lands Grants Act, the Oil and Gas Production and Conservation Act and regulations pursuant thereto. Both the Canada Oil and Gas Land Regulations and the Oil and Gas Drilling and Production Regulations were under review during 1972. The former regulations are being amended; the latter regulations may be amended with respect to "onland" areas, but new operational and conservation regulations are being drafted for the off-shore areas pursuant to the Oil and Gas Production and Conservation Act.

An oil and gas exploration permit may be granted either upon application or, in respect of land previously held under permit, by sale through public tender for three, four or six years, depending upon latitude and region. A permit is renewable for up to six one-year periods, with provisions that the appropriate Minister may grant additional renewals under special terms and conditions. The permittee is obligated to undertake exploratory work in an amount no less than five cents per acre for the first 18 to 36 months increasing to 15 to 20 cents per acre for subsequent periods of the primary term. Work obligations for each one-year renewal period increase up to 50 cents per acre. The permittee must post a guarantee deposit in the form of cash, bonds, or promissory notes prior to each work period. These deposits are returned upon receipt of satisfactory evidence that exploratory work has been performed, and are forfeited to the Crown in the event the permittee fails to fulfil the work obligations. Oil and gas leases may

be selected in accordance with prescribed guidelines for up to 50% of a permit area, with that portion not converted to lease reverting to the Crown.

An oil and gas exploration permit may be issued to any individual over 21 years of age or to any joint-stock company incorporated or licensed to do business in Canada, or incorporated in any province of Canada. Extraterritorial companies applying for permits in the Northwest Territories must be registered under the Companies Ordinance of the Northwest Territories. An oil and gas lease may be granted to a permittee where the Minister of the Department involved is satisfied that the applicant is a Canadian citizen over 21 years of age and will be the beneficial owner of the interest granted, or to a corporation where such corporation is incorporated in Canada, and where the Minister is satisfied that at least 50% of the issued shares of the corporation are beneficially owned by Canadian citizens or that the shares of the corporation are listed on a recognized Canadian stock exchange and that Canadians will have an opportunity of participating in the financing and ownership of the corporation, or the operation is wholly owned by a corporation that meets either of these two requirements.

The Oil and Gas Production and Conservation Act provides for comprehensive control over all oil and gas operations in the territories and off-shore regions including such matters as safety, the prevention of waste and pollution, production, conservation, storage, transmission, and unitization of oil and gas fields. An Oil and Gas Committee of five members appointed by the Governor in Council is empowered to hold inquiries, to hear appeals, and to make orders in connection therewith.

Federally owned mineral rights within the provinces that are available for development (except those in Indian lands) are administered by the Department of Energy, Mines and Resources under regulations promulgated pursuant to the Public Lands Grants Act.

12.3.4 Provincial mining laws and regulations

In general, all Crown mineral lands lying within the boundaries of the several provinces (with the exception of those within Indian reserves, national parks and other lands which are under the jurisdiction of the federal government) are administered by the respective provincial governments. The exception is Quebec where all mineral lands except those granted to individuals in the townships prior to 1880 are administered by the province; also, mining rights on federal lands in Quebec are administered by the province.

The granting of land in any province except Ontario no longer automatically carries with it mining rights upon or under such land. In Ontario, mineral rights are expressly reserved if they are not to be included. In Nova Scotia, no mineral rights belong to the owner of the land except those pertaining to gypsum, agricultural limestone and building materials, and the Lieutenant-Governor in Council may declare deposits of either limestone or building materials to be minerals. Such declaration is to be based on economic value or to serve the public interest. In such case, the initial privilege of acquiring the declared minerals lies with the owner of the surface rights who must then conform with the requirements of the Mines Act. In Newfoundland, mineral and quarry rights are expressly reserved. Some early grants in British Columbia, Alberta, Saskatchewan, Manitoba, New Brunswick, Quebec and Newfoundland also included certain mineral rights. Otherwise, mining rights must be obtained separately by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (or veined minerals and bedded minerals), fuels (coal, petroleum and gas) and quarrying. Provincial mining regulations under these divisions are summarized in the following paragraphs.

In most provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held, and the royalties to be paid.

General minerals are sometimes described as quartz, lode, or minerals in place. With the exception of British Columbia, the most elaborate laws and regulations apply in this division. In all provinces except Alberta and Saskatchewan, a prospector's or miner's licence, valid for one year, must be obtained to search for mineral deposits, the licence being general in some areas but limited in others; a claim of promising ground of a specified size may then be staked. In Manitoba and British Columbia a licence is required only for staking and any number of dispositions may be staked under one licence. A claim must be recorded within a time limit and payment of recording fees made, except in Quebec where no fees are required. Work to a specified value per annum must be performed upon the claim for a period of up to ten years

except in Quebec where a development licence may be renewed on a yearly basis; also in Manitoba and Saskatchewan there is no work commitment in the first year of the claim. There is no time limit in British Columbia but \$500 assessment work, of which a survey may represent two fifths, must be performed and recorded before a lease may be obtained. In Quebec, a specified cost of work must be performed and any excess amount expended may be applied to subsequent renewals of the licence. The taxation applied most frequently is a percentage of net profits of producing mines or royalties. In Saskatchewan, subsurface mineral regulations covering non-metallics stipulate the size and type of dispositions that may be made in order to maintain the disposition in good standing, provide for fees, rentals and royalties, and set out generally the rights and obligations of the disposition holder.

In provinces where coal occurs, the size of holdings is laid down together with the conditions of work and rental under which they may be held. In Quebec, the search for petroleum and natural gas may be carried out under a prospecting or search permit followed by a working lease; the search permit covers a period of five years and an acreage of not over 60,000 acres, whereas the lease extends over a 20-year period and an acreage not over half the acreage of the permit. In Nova Scotia, mining rights to certain minerals, including petroleum, occurring under differing conditions may be held by different licensees. Provision is sometimes made for royalties. Acts or regulations govern methods of production. In the search for petroleum and natural gas, an exploration permit or reservation is usually required; however, in Manitoba, Saskatchewan, Alberta and British Columbia leases usually follow the exploration reservation whether or not any discovery of oil or gas is made. In Alberta, exploration costs are applicable in part on the first year's lease rental, in Manitoba they may be applied to the lease rental for a period of up to three years and, in British Columbia and Saskatchewan, credit is given for up to 24 months' rental, having regard to the amount of excess credit established. In other provinces, the discovery of oil or gas is usually prerequisite to obtaining a lease or grant of a limited area, subject to carrying out drilling obligations and paying a rental, a fee, or a royalty on production.

Quarrying regulations define the size of holdings and the terms of lease or grant. In Nova Scotia, sand deposits of a quality suitable for uses other than building purposes and limestone deposits of metallurgical grade belong to the Crown; gypsum quarries belong to the owner of the property. Under the New Brunswick Quarriable Substances Act, 1968, quarriable substances (ordinary stone, building and construction stone, sand, gravel, peat and peat moss) are vested in the owner of the land in or on which they lie; the Minister with the approval of the Lieutenant-Governor in Council may designate a shore area lying outside Crown land to be subject to the Act; and no person shall take or remove or cause to be taken or removed more than one half cubic yard of a quarriable substance from Crown land or a designated shore area without obtaining a permit or lease. On Quebec public lands and on those granted to individuals after January 1, 1966, the stone, sand and gravel, like other building materials, belong to the Crown; quarries located on land granted to individuals prior to 1966 remain in the possession of the owners of the surface; the right to exploit all building materials except sand and gravel may be acquired by ordinary staking-out and the right to work sand and gravel beds is set by regulation. In Saskatchewan, sand and gravel on the surface and all sand and gravel obtainable by stripping off the overburden or other surface operation belong to the owner of the surface of the land. In Alberta, sand, gravel, clay and marl recovered by excavating from the surface belong to the owner of the surface of the land. Copies of mining legislation including regulations and other details may be obtained from the provincial authorities concerned.

Chapter 13

Energy

In an industrialized society the term energy encompasses not only the final form of energy as purchased by the ultimate customer in the form of electricity, heat, steam or fossil fuel but also the resources such as generating stations, refineries, pipelines and transmission systems which are required to process and transport the energy. Energy may be employed directly by the combustion of fossil fuels (coal, oil and natural gas) or it may be converted into a secondary form — electricity, using as a primary source the same fossil fuels. In addition, electrical energy is produced from hydraulic resources and in thermal generating stations based on the controlled fission of uranium.

Topography, geology, precipitation and geography all play a significant role in the availability of energy resources, and in all of these Canada is singularly well-endowed.

Canada's energy sources of water power are invariably converted to electrical energy and limited only by their accessibility and by the state of the technology required to transmit developed power to areas of demand. Unlike other forms of energy, electricity cannot be economically stored in large quantities. Consequently, it is produced only to meet a specific demand and this fact accounts for a substantial reserve of generating equipment which is designed to meet daily and seasonal variations in that demand.

The non-renewable fossil fuel resources of coal, oil and natural gas are more diverse in their uses. Coal is used not only to fuel steam plants to produce electricity, and as a direct-heating commodity at the industrial and domestic levels, but carbonized coking coal is essential in steel manufacturing. Oil is refined into a variety of products to operate engines of all types (including automobile, railway and aircraft), serves as a source of heat for furnaces and boilers (some of which is converted to electrical energy) and also forms the base of a vast petrochemical industry. The supply of oil is limited not only by the number, extent and dispersal of the sites where it may be found but also by the capacity and accessibility of the total delivery system, including the pipelines needed to move raw crude to the refineries or by the relative ease of access for imported crude, destined for refining, entering the delivery system at deep-water ports from tankers of ever-increasing size. Natural gas, some of which may be used as it is found, must also be gathered and distributed through pipelines to market areas or to treatment plants, as is the case with much of the gas in Canada, to be purified and to have valuable by-products such as the pentanes, butane and sulphur removed.

While natural gas is not well suited to mobile applications it is directly competitive with oil and coal in stationary fuel use. Its clean burning qualities and simplicity in burning and control make it especially attractive for domestic and industrial use.

It may seem difficult to separate the fossil fuel industry from the mining industry but once the products are extracted and enter the delivery system, which consists of the gathering, transmission, processing and marketing chain, they become a part of the energy supply base.

13.1 Energy policy

13.1.1 Department of Energy, Mines and Resources

The Energy Development Sector of the Department is responsible for co-ordinating, promoting and recommending policies and programs with respect to energy on a national scale. Its mandate entails studies and appraisals of all aspects of energy resource development, production, transportation, processing and use. It is concerned with such matters as the quantity and quality of existing and projected resources of energy; the demand for energy in Canada and whether there are surplus resources available; regional development aspects associated with energy; energy transportation systems and the lead time for their development; policies to control foreign ownership of energy resources; the role of the federal government itself vis-à-vis energy resource development; the economic impact of the energy industries and the financial needs of those industries; the scale and type of energy research that should be carried on in Canada; the outlook for developing new energy resources to meet future needs; and the environmental problems posed by the development, transportation, processing and use of various energy forms. It also has a mandate for the management and conservation of non-renewable resources in certain land and off-shore areas under federal

jurisdiction. All of these matters require increased attention on the part of government because of the growing importance of energy in Canada's economic development and international relations.

The Sector is divided into two operating components. One of these consists of the Resource Management and Conservation Branch which has as its principal function the administration and management of federal interests in mineral resources off Canada's east and west coasts and in Hudson Bay and Hudson Strait.

The second operating component, made up of eight sections, is responsible for the energy policy functions of the Department. Six of these sections are responsible for formulating policy advice on individual energy resources and are headed by senior energy advisers. The other two sections have responsibilities relating to energy in its total context: the first with reference to financial and corporate aspects and the second, for co-ordinating energy information and policy recommendations from the specialist sections into an integrated total energy policy assessment.

13.1.2 National Energy Board

Since its establishment in 1959 the National Energy Board, which reports to Parliament through the Minister of Energy, Mines and Resources, has pursued its two main functions, regulatory and advisory, for the broad purpose of ensuring that the best interests of Canada are served in the use of its energy resources. Its regulatory functions are quasi-judicial or administrative in nature. The quasi-judicial functions pertain to the granting of certificates authorizing the construction of interprovincial and international pipelines and international power lines, the issuance of licences to export gas or power or to import gas or motor gasoline as well as the regulation of rates, tolls and tariffs of oil and gas pipelines under the Board's jurisdiction. Regulatory functions of an administrative character include safety orders in respect of pipelines, and approval of pipeline utility crossings.

The Board consists of seven full-time members appointed by the Governor in Council to hold office for a term of seven years, with provision for reappointment until a member reaches the age of 70.

Part II of the Act confers broad advisory functions on the Board including the requirement that it study, report on and recommend to the Minister "such measures within the jurisdiction of the Parliament of Canada as it considers necessary or advisable in the public interest for the control, supervision, conservation, use, marketing and development of energy and sources of energy". The Minister may also require the Board to prepare energy studies and reports.

The Board maintains a continuous review of the price of all gas licensed for export and where, in the Board's opinion, there has been a significant increase in prices for competing gas supplies or for alternative energy sources, the Governor in Council may, on the recommendation of the Board, order the establishment of a new price.

The Board is also charged with administration of the National Oil Policy established to foster the development and use of oil resources within Canada. Attaining this objective involves protecting indigenous crude oil products in domestic markets, to which the Board's motor gasoline import licensing is related, and encouraging the export of surplus oil when an adequate determination has been made of Canadian requirements.

The National Power Policy, announced in 1963, encourages the development of large-scale power sources at lowest possible cost, the distribution of the benefits thereof as widely as possible through interconnections between power systems within Canada, and the long-term export of large blocks of power where such exports will induce early development of Canadian power resources. This policy also encourages the export of various classes of power under suitable interconnection agreements to provide for mutual assistance in emergencies and for other economic benefits that can be derived by both parties through co-ordinated operation and development. To further these aims, the Board co-operates with other agencies in the consideration of interprovincial and international interconnections of electric power systems. It is worth noting that most of the major electrical utilities in Canada and the United States are now interconnected with neighbouring systems and operate as part of one vast power grid.

In February 1971 the Board convened its first public hearing under Part IV of the Act for the determination of just and reasonable tolls for a major gas pipeline company. The hearing,

involving an application by TransCanada PipeLines Limited to increase rates, was divided into two phases. The decision on the first phase, establishing the applicant's total cost of service, was issued in December 1971. The second phase, considering just and reasonable tolls and tariffs to recover such total cost of service, continued in 1972 and a decision is expected in the spring of 1973.

The Board conducts regular examinations of the accounts and records of gas and oil pipeline companies under its jurisdiction. Such examinations ensure conformity with the Board's Uniform Accounting Regulations and provide detailed financial information which is essential to administering the regulatory functions of the Board. The Board also conducts special studies of a financial nature and maintains close liaison with various sectors of the national and international financial communities.

The Board conducts continuing studies of energy matters in order to maintain a bank of current knowledge which is necessary for the Board to perform its regulatory and advisory functions. Energy supply and demand forecasts are a continuing part of the Board's work. Studies include both the Canadian and foreign markets since fuels and, to a more limited extent, electric power are traded internationally.

13.2 Fuels

The word "fuel", derived from the archaic French *fouaille*, implies a heat source. Up to the present time, mankind has depended for its survival and development on organic fuels but, with the emergence of nuclear energy for civilian use, inorganic fuel is now assuming economic significance.

Fossil fuels with their main component — carbon — will continue to provide the largest range of products from the pure form to compounds that are useful to man. They may even provide nutrition to man if natural foods become scarce. Although the world is benefiting at present by the upsurge in the availability of hydrocarbons, coal as a carbon source should not be discarded. In fact, all fossil fuels in the future may have to contribute collectively to the energy and chemical needs of the world.

The challenge to the bulk use of fossil fuels seems to be nuclear energy which may constitute about 20% of the world's energy by the year 2000, by which time the consumption of energy may be quadrupled from the present level of about 53 million barrels per day of oil equivalent. The world's present economic uranium resources are considered to be larger than the total usable fossil fuel resources but they are subject to the principal uncertainty — the efficiency of fuel utilization which at present amounts to only about 1% of the theoretical potential energy. Nevertheless, nuclear energy may make rapid strides in the fields of generation of electric power, district or large-complex heating, and some types of transportation. Higher extractions of uranium and thorium from lower-grade ores and the development of breeder reactors may ensure that the supply of source materials is adequate.

In Canada, the fortuitous occurrence of ores in strategic and geographically favourable locations together with the creation of nuclear technology gives great impetus to the development of nuclear energy. Canada is spending about 70% of its federal energy research budget on nuclear research and has trained many nuclear scientists and engineers and hence may be expected to play a role in the world with its nuclear industry integrated from raw material to final product and with its ability to provide engineering skill to countries that need it.

Fuels may be described as having four distinct though overlapping functions — provision of direct-heat energy; provision of electric power, so far, by indirect conversion; provision of motive power; and provision of source materials for partial or total chemical conversion. An approximate energy-use balance in Canada has been drawn up, demonstrating the relative impact made by the principal fuels, as shown in Table 13.1.

13.2.1 Petroleum and natural gas

The need to provide new energy sources in Canada has given considerable impetus to the search for oil and gas, particularly in the frontier areas of the North. This aspect of the oil and gas industry, as well as other developments in the production of these products, is covered in Section 12.1.4 of the preceding Chapter.

The composition of the Canadian net supply and consumption of various petroleum products and natural gas is as indicated in Table 13.2.

Natural gas requirements are met almost entirely from domestic sources. In 1971 requirements totalled 1,288.0 MMMcf of which imports supplied 14.4 MMMcf. The market for Canadian-produced natural gas was divided between domestic demand (1,292.0 MMMcf) and exports to the United States (910.8 MMMcf). The United States has been increasingly deficient in domestic supply of natural gas and hence there is a growing market for Canadian gas in that country. Sufficient reserves must be set aside to meet future Canadian requirements prior to export approval. On the basis of this policy, an export application in 1971 was rejected because reserves available at the time were insufficient to meet the new requirement.

In the case of petroleum products, Canadian demand for crude oil was met almost equally from domestic and from import sources. This division of the Canadian market between imported and domestic crude oil results from the "National Oil Policy" of 1961 whereby the Canadian market west of the arbitrarily drawn "Ottawa Valley Line" (essentially west of Quebec) is supplied from domestic sources while the market east of the line relies on imports from foreign sources. Canadian crude oil prices have traditionally been higher than those from foreign sources and it has therefore not been economic to supply Montreal and the Maritimes from western Canada. Exports of Canadian crude oil go to the United States. There is a direct link between the Alberta and Saskatchewan fields and the Chicago and other Great Lakes markets via the pipeline system of the Interprovincial Pipe Line Company and from Alberta and British Columbia fields via the Trans Mountain Pipeline system to refineries in the state of Washington. Western Canadian producers exported 273 million bbl of crude oil to these markets in 1971.

13.2.2 Petroleum refining and marketing

Petroleum refining, one of Canada's largest manufacturing industries, is concerned with the distillation and cracking of crude petroleum into a number of economically useful end-products such as motor gasoline, fuel oils, lubricating oils and greases, petrochemical feedstocks and asphalt.

The crude oil refining capacity of Canada's 40 refineries increased to 1,675,500 barrels per day (b/d) in 1971 (Table 13.3), an increase of 24% from 1970. Of this increase, some 12% was in the Atlantic Provinces, 9% in Quebec and 3.5% in the Prairie Provinces, while capacity in Ontario and British Columbia remained unchanged. Much of the increase in the Maritimes and Quebec is attributable to two large refineries, one at Point Tupper, NS and the other at St-Romuald, Que. The latter, with a capacity of 100,000 b/d, is the largest refinery ever built in Canada. Both refineries were designed to supply markets in the United States as well as Canada. The increased refining capacity in the Prairies was the result of one company replacing its smaller refineries with one much larger and more efficient.

During the year Canadian refineries operated at a rate of 1.39 million bbl of crude oil per day, an 8.6% increase over 1970 and representing approximately 83% of estimated capacity at the end of the year (Table 13.4). Refineries west of the Ottawa Valley Line, which, according to the National Oil Policy may use only Canadian crude oil, increased their consumption by 3.2%. Those east of the line, in Quebec and the Maritimes, relying on foreign crudes, increased their deliveries by 17% to 669,000 b/d. Much of this latter increase was again the result of the two new refineries. As a result of the increased refinery capacity, particularly in eastern Canada, refined product imports declined by some 46,000 b/d to 148,000 b/d.

The main source of crude oil imported into Quebec and the Maritimes was Venezuela which increased its exports to Canada by 11% to 406,000 b/d. Imports from the Middle East exceeded 156,000 b/d and Nigeria accounted for 66,000 b/d. The remaining major foreign source was Colombia which contributed 21,000 b/d.

Canadian exports of refined petroleum products increased by 41% to 100,000 b/d in 1971. A great part of this increase was due to a substantial growth in heavy fuel oil exports to the northeastern region of the United States. As already noted, the ability of refineries in Quebec and the Maritimes to serve a part of this important market has been substantially increased with the establishment of the two new large refineries at St-Romuald and Point Tupper. This capacity will be further increased by the 100,000-b/d refinery under construction at Come-By-Chance, Nfld, which is expected to begin operations in 1973.

The production of Canadian oil refineries was predominantly fuel oils and motor gasoline (the former accounted for 52% of refinery output and the latter for approximately 33%). The remaining output was divided among such other products as aviation gasoline and turbo fuel (3.4%), liquefied petroleum gases (4.3%), petrochemical feedstocks (2.1%) and asphalt (3%).

13.2.3 Natural gas processing and marketing

In contrast with petroleum refining, which involves the distillation of crude oil into a variety of fuels, natural gas processing involves the removal of impurities and by-products from the desired fuel. In addition, while petroleum refineries have, for economic reasons, been traditionally located close to their consuming markets and have tended to be large relative to these markets, natural gas processing plants are located near sources of supply and are designed in terms of the nature and size of the field sources. Thus, while in 1971 there were but 40 petroleum refineries in Canada, all located close to, or with easy access to the major markets, there were some 163 gas processing plants of which 146 were located in Alberta, seven in Saskatchewan, five in British Columbia, four in Ontario and one in the Northwest Territories.

Marketed or processed natural gas consists chiefly of methane with small amounts of other combustible hydrocarbons such as ethane and propane. Processing is necessary since raw natural gas may vary widely in composition. Thus, in addition to the usually predominant methane, there may be varying proportions of ethane, propane, butane and pentane plus. Another normal constituent is water vapour. While hydrogen sulphide is not present in all natural gas there is sufficient to provide an important source of sulphur as a by-product of natural gas processing. Other non-hydrocarbon gases which may be present, usually in small amounts, are carbon dioxide, nitrogen and helium.

Canadian natural gas processing capacity increased by 2,477 million cubic feet per day (MMcf/d) in 1971, the greatest annual increase in the history of the industry. This increase was mainly attributable to the completion of five large new plants and major expansion of three existing plants. Gas processing capacity was 13,000 MMcf/d by the end of the year. Processing capacity included 105,792 b/d for propane, 57,319 b/d for butane and 189,439 b/d for pentane plus. Total residue gas capacity was 10,956 MMcf/d, of which 10,406 MMcf/d was available for commercial consumption. Although a major expansion of processing capacity is under way in northern British Columbia, most gas processing capacity is concentrated in Alberta. At the end of 1971, Alberta accounted for more than 88% of the gas processing capacity, 99% of the liquid recovery capacity and 98% of the sulphur recovery capacity in Canada.

Sales of gas to Canadian consumers rose by 9.1% in 1971 to 2,743 MMcf/d. This compares with an 8.8% increase recorded the previous year. Imports of gas from the United States were at the rate of 39 MMcf/d (1.4% of consumption) while exports to the United States were at the rate of 2,495 MMcf/d, approximately equal to the rate of Canadian consumption. This export figure represented a 16.8% increase over the comparable figure for 1970.

Approximately two thirds of the increased Canadian consumption in 1971 was accounted for by industrial users whose demand rose 11% to 1,489 MMcf/d (approximately 54% of total gas sales in Canada). Demand for commercial consumption also rose by 11% to 567 MMcf/d, about 21% of total Canadian sales, while residential consumption increased by 4% to 687 MMcf/d (25% of Canadian sales).

About two thirds of the increase in Canadian sales in 1971 resulted from increased consumption in Ontario. Sales in that province rose 13.2% to 1,259 MMcf/d, nearly 46% of Canadian consumption. In Alberta, the second largest consuming province, the increase was 68% to 681 MMcf/d which was about 25% of all Canadian consumption in 1971.

13.2.4 Pipelines

Oil. There were 40 oil pipeline companies operating in Canada at the end of 1971. Principal statistics of movements of oil through these lines appear in Table 13.5. The prime components of the network of Canadian oil pipelines are the trunks of the Interprovincial Pipe Line Company and the Trans Mountain Pipe Line Company Ltd. which carry the bulk of domestic crude oil west of the Ottawa Valley. Refineries not relying on these systems are those located in oil-producing regions such as Calgary and Edmonton. The Interprovincial system carries crude oil eastward from Edmonton, receiving and discharging oil at various locations along its length. The Trans Mountain system operates similarly westward from Edmonton. Supplying these two trunk lines are pipeline systems funnelling oil from hundreds of fields into storage tanks at the pipeline terminals. Some of these feeder lines are impressive in themselves, not only in size of pipe and in length of route but in the volume of oil that they transport. Most of the feeder lines are, as might be expected, in Alberta, because of the predominance of that province in oil production.

The main pipeline terminal at Edmonton has ten crude oil feeder lines, varying in length from Interprovincial's 32-mile extension to Redwater to the 1,240-mile line of Peace River Oil. Other companies forming part of this important collector system, with their total length, daily capacity, and direction in relation to Edmonton are the following: Canadian Industrial Gas and Oil, 82 miles, 15,000 bbl, running southeast; Federated, 647 miles, 281,000 bbl, from the northwest; Great Canadian Oil Sands, 266 miles, 50,000 bbl, north-northeast; Gulf Alberta, 410 miles, 73,000 bbl, south-southeast; Imperial, 378 miles, 72,000 bbl, southwest; Pembina, 931 miles, 180,000 bbl, west-southwest; Rainbow, 692 miles, 225,000 bbl, northwest; and Texaco Exploration Canada, 173 miles, 130,000 bbl, south.

In addition, three pipelines are connected to the Interprovincial at Hardisty, some 100 miles southeast of Edmonton. Here, Gibson Petroleum Company Ltd. delivers up to 15,000 b/d of oil from fields just south of the pipeline terminal. Husky Pipeline Ltd. operates a multiple-line system in which one line is used to transport condensate from Hardisty to mix with the heavy asphaltic crude found at Lloydminster. The condensate-crude blend is returned to Hardisty through eight- and ten-inch lines having a total capacity of 77,000 b/d. The third pipeline connection, Bow River Pipe Lines Ltd. with a capacity of 34,000 b/d, carries crude from the most southerly oilfields in Alberta, near Taber. Home Oil Company Limited operates a pipeline serving refineries in the Calgary area with oil from fields north of the city; the line also has connections with the Rangeland pipeline which, in turn, is linked to the Texaco line going north to Edmonton.

Trans Mountain has a second receiving terminal in Alberta at Edson where the Peace River pipeline makes deliveries to Trans Mountain from fields to the north. In British Columbia, Westcoast Petroleum Ltd. carries crude over a distance of 500 miles from fields near Fort St. John in the northeastern part of the province to the Trans Mountain pipeline at Kamloops; this line has a capacity of 66,500 b/d.

Four main pipeline systems carry crude oil from Saskatchewan fields to the Interprovincial pipeline. Largest of these is the Westspur Pipe Line Company - Producers Pipelines Ltd. network, with a capacity of 175,000 b/d, which delivers crude from the important southeast Saskatchewan producing area to the Interprovincial terminal at Cromer, Man., and also carries crude delivered to it by Trans-Prairie Pipelines, Ltd. from fields in the Midale area of southeast Saskatchewan. In 1970, a twin line 100 miles in length was built for Murphy Oil Company Ltd. from Lone Rock in the Lloydminster field to Kerrobert, Sask. on the Interprovincial trunk line. A four-inch line carries condensate from the Interprovincial line at Kerrobert to Lone Rock where it is blended with heavy crude oil from the Lloydminster field to make it light enough for transport by pipeline. A 10-inch line then returns the blend to the Kerrobert pumping station where it enters the Interprovincial main line for transport east. The South Sask. Pipe Line Company, with a capacity of 115,000 b/d, takes medium-gravity crude from fields near Swift Current in southwest Saskatchewan to the Interprovincial pipeline at Regina. The fourth system is the Gulf Saskatchewan Pipe Line Limited, with a capacity of 10,000 b/d, which carries oil from the Coleville-Dodsland area to Interprovincial's terminal at Kerrobert.

The Manitoba System of Trans-Prairie Pipelines, Ltd. is the only pipeline in Manitoba serving the producing fields in the general area of Virden. It carries crude to the Interprovincial terminal at Cromer and has a capacity of 27,000 b/d.

Interprovincial Pipe Line Company's system is Canada's longest oil pipeline. It incorporates a wholly owned subsidiary in the United States, Lakehead Pipe Line Company Incorporated, and has a right-of-way length of 2,747 miles including a 95-mile lateral to Buffalo, New York. In 1971, 81 miles of 20-inch loop, in two sections, were added to its main line between Sarnia and the Welland Canal. Additional pumping units added in 1971 increased mainline capacity of the system to 1,308,000 b/d out of Cromer, Man.

Interprovincial serves 51 refineries; three at Edmonton; one at Lloydminster via the Husky pipeline; one at Moose Jaw via B-A Saskatchewan pipeline from Stony Beach; two at Regina; two at Winnipeg via Winnipeg pipeline from Gretna; 35 in the United States either directly or through connecting carriers; three at Sarnia; two at Oakville; one at Clarkson; and one at Port Credit.

The system of Trans Mountain Pipe Line Company Ltd. extends from Edmonton to Vancouver via Jasper and has a right-of-way length of 780 miles, including a section of 57 miles in the United States which belongs to a wholly owned subsidiary of Trans Mountain.

Trans Mountain serves nine refineries; one at Kamloops; four at Vancouver and four in the Puget Sound region of Washington State. Under a contract with Gulf Oil Canada Limited, facilities were completed at the Vancouver terminal to handle storage and transfer of liquid propane from railway tank cars to refrigerated Japanese tankers. First loading under the ten-year contract was made in October 1966 and, in 1971, 3,620,000 bbl were delivered to tankers.

The Montreal refinery centre is served by a 236-mile pipeline which is a joint system of Montreal Pipe Line Company Limited and its wholly owned subsidiary in the United States, Portland Pipe Line Corporation. This line takes delivery of tanker-borne crude from Venezuela, the Middle East and Africa at Portland, Maine. In 1965, the company completed a 24-inch pipeline paralleling the existing 18-inch and 24-inch crude oil lines. An additional 24-inch line under the St. Lawrence River was completed in 1967 to serve refineries in Montreal and, at the same time, 16- and 20-inch lines were installed for future use. Present capacity of the system is 536,000 b/d. Operating statistics of oil pipelines are given in Table 13.6.

Product pipelines. Traditionally, a product pipeline carries refined products from oil refineries to truck terminals in large consuming centres. However, with the growth of natural gas processing in Canada resulting in large volumes of liquid hydrocarbons such as propane, butane and pentanes plus being produced, a new type of line has emerged to bring these products to markets or to refineries.

Three product lines in eastern Canada supply markets in Ontario with refined petroleum products. Two of these, Sun-Canadian Pipe Line Company Limited and Sarnia Products Pipe Line, run from refineries at Sarnia to bulk plants in London, Hamilton and Toronto. Trans-Northern Pipe Line Company, once a pipeline carrying products from Montreal to markets in Ontario as far west as Hamilton, now has a two-way flow. Products from Montreal are delivered only in the area east of Brockville, including the Ottawa Valley; products from refineries west of Toronto are carried eastward as far as Kingston.

In western Canada, the Petroleum Transmission Company pipeline carries propane, butane and pentanes plus from a plant at Empress, Alta. to Winnipeg, Man., a distance of 578 miles. The predominant product carried is propane which is also marketed at various locations along the line. Elsewhere in Alberta the Rimbey Pipe Line Co. Ltd. transports condensate from the Rimbey gas plant and takes deliveries from the Rangeland condensate pipeline to serve areas north of Calgary as far as Edmonton. Also going to Edmonton from the Leduc gas conservation plant are three pipelines owned by Nisku Products Pipe Lines Company Limited, one each for propane, butane and pentanes plus. Near Calgary, Home Oil Company Limited operates a condensate pipeline to serve refineries there and also to make deliveries to the Rangeland condensate pipeline. In 1969, a 186-mile, 8- to 12-inch pipeline was built by Dome Petroleum Limited to transport mixed natural gas liquids from the Alberta Natural Gas Company Limited's new gas reprocessing plant at Cochrane to Interprovincial's Edmonton terminal. The liquids are transported to plants at Superior, Wisconsin, and Sarnia, Ont., where they are fractionated into propane, butane and other products for use in the surrounding market areas. Other condensate pipelines in Alberta are associated primarily with production and do not serve end-users.

In western Canada the new pattern of product distribution established by Gulf when they began to reorganize their manufacturing and marketing operations in 1969 is now being followed by Imperial Oil Limited which began to change its petroleum product supply system early in 1972. New product terminals will be built at major Prairie centres and supplied from a large new Edmonton refinery through existing pipeline systems. The principal distributor of the products produced by the new large Edmonton refineries will be Interprovincial which has converted its original 20-inch crude oil line out of Edmonton exclusively to products and gas liquids transportation. Another integral component of Gulf's product transportation system is its 193-mile, 10-inch line from Edmonton southward to terminals in Red Deer and Calgary, constructed in 1970.

Pipeline tariffs. The tariffs charged by oil pipeline carriers are subject to over-all regulation by the National Energy Board. Typical of the rates from Edmonton in effect at the end of 1972 were the following: to Vancouver, over a distance of 718 miles, 40.0¢ per barrel; to Regina, 438 miles, 20.7¢; to Winnipeg, 847 miles, 32.7¢; to Sarnia, 1,743 miles, 48.0¢; and to Port Credit,

1,899 miles, 51.0¢ per barrel. The rate for crude imported to the Montreal refinery complex through the 236-mile pipeline from Portland, Maine, is 11.0¢ per barrel.

Natural gas pipelines. The authorization of large-volume gas removal from British Columbia and Alberta, beginning in the mid-1950s, led to the development of the first major gas transmission pipelines in Canada. These major lines provided the framework for development of the extensive pipeline network now serving most centres of population from Vancouver to Montreal; gas is pumped through the system for export at seven points along the Canada - United States border. Planning is under way to extend major transmission lines northward into areas not now served to transport gas from the Canadian Arctic islands and the Prudhoe Bay area of Alaska to southern markets. Three groups of companies have put forward proposals for such pipelines and substantial sums are being spent on research to assess the technical problems and environmental effects of pipeline construction in the North. To assist companies in these initial planning phases, the federal government issued a set of guidelines outlining the criteria which must be met to protect the native people and the northern environment during construction and operation of the pipelines.

Pipelines are usually categorized under three headings — gathering lines, transmission lines and distribution lines. Gathering lines take gas from producing wells or treatment plants to the field gate or some other delivery point. Transmission lines normally receive gas from gathering lines and transport it through large-diameter pipelines to distributors for delivery to the ultimate consumer. At the end of 1971, a total of 62,860 miles of pipeline were in operation of which 7,166 miles were gathering, 20,601 miles were transmission and 35,093 miles were distribution.

Unlike oil pipeline companies which are common carriers transporting oil for a fixed charge, gas pipeline companies, with few exceptions, own the gas they transport. The principal and very important exception is The Alberta Gas Trunk Line Company which delivers virtually all of the gas exported from Alberta, where most Canadian gas reserves are located, to the main transmission companies at the provincial boundary. The Alberta Gas Trunk system contains 3,493 miles of pipeline.

Some details of the main transmission systems are contained in the following paragraphs. Two gas trunk lines serve Canada: the TransCanada PipeLines Limited system and the Westcoast Transmission Company Limited.

The TransCanada pipeline, originating at the Alberta border near Burstall, Sask., follows a route eastward to a point near Winnipeg, where it branches into two lines. One continues eastward into Ontario through Thunder Bay, then arches through the clay belt before swinging south via North Bay to Toronto, where one branch goes westward and another follows the shore of Lake Ontario and the St. Lawrence River to Montreal and the United States border. A number of lateral lines extend from the main transmission line to serve communities along the route. The second line from Winnipeg goes south to the United States boundary at Emerson where it connects with the Great Lakes Gas Transmission Company system, jointly owned by TransCanada and an American company. This pipeline follows a route south of Lake Superior through the Straits of Mackinac and east of Lake Michigan to reconnect with the TransCanada system at Sarnia, Ont. The TransCanada system is Canada's longest pipeline, having a total length of 4,007 miles including loop lines. The maximum daily gas delivery through the system in 1971 was 2,803,000 Mcf. Export sales averaged 754,400 Mcf daily.

The Westcoast Transmission Company Limited pipeline originates at the Beaver River field on the Yukon - British Columbia border, extends southeastward through the Fort Nelson and Fort St. John areas and follows a route through the British Columbia interior to Vancouver and the United States border at Sumac, BC. A number of lateral lines gather gas supplies from fields in northeastern British Columbia and western Alberta, and the system was extended north to the Pointed Mountain field in the Northwest Territories in 1972. Total pipeline in the Westcoast system exceeded 2,000 miles in 1971.

Although the Alberta Natural Gas pipeline is only 107 miles long, it forms a vital link in a major gas export chain which carries Canadian gas as far south as California. The pipeline connects with The Alberta Gas Trunk Line Company pipeline at Crowsnest Pass on the Alberta border, crosses southeastern British Columbia to the international border near Kingsgate and connects with the Pacific Gas Transmission Company system, which transports the gas in the United States.

Among the many other natural gas pipeline systems operating in Canada, some are devoted exclusively to gathering gas in producing fields, while others distribute gas received from main transmission lines to gas customers. Several large systems combine elements of gathering, transmission and distribution. Among the larger systems, Inland Natural Gas Co. Ltd. distributes gas to a number of centres in interior and southern British Columbia. In west-central British Columbia, the pipeline of Pacific Northern Gas Ltd. serves communities and industries along a 435-mile route between the Westcoast main line at Prince George and the Pacific Coast cities of Prince Rupert and Kitimat. Canadian Western Natural Gas Company Limited and Northwestern Utilities Limited serve markets in central and southern Alberta with a total of more than 8,654 miles of pipeline. Saskatchewan Power Corporation delivers all gas sold in Saskatchewan through a 6,846-mile transmission and distribution system serving most of the populated areas of the province. Northern and Central Gas Corporation Limited operates probably the most geographically widespread distribution system in Canada serving industries and communities adjacent to the TransCanada system from Winnipeg as far east as the Montreal area. Two large utility companies serve the highly populated and industrialized areas of southern Ontario. The Consumers' Gas Company operates in the Toronto area, the Niagara peninsula and eastern Ontario while Union Gas Limited serves the southwestern corner of the province. These are only some of the many gas pipeline systems that make up a growing network of lines serving domestic, commercial and industrial customers in all provinces except Prince Edward Island, Nova Scotia and Newfoundland.

More detailed information on throughput in the Canadian gas pipeline system appears in Table 13.7.

13.2.5 Coal

In 1971, coal used as a primary energy source for thermal electric power generation in Canada totalled 17.3 million tons, up from 15.2 million tons in 1970. This proved to be a slight decrease (from 72.4% to 69.5%) in the rapidly growing total Canadian thermal electric power. In the Prairie Provinces, low rank coal can be economically strip-mined and has become a prime source of electrical energy. Ontario, the prime user of thermal coal, used some 11% more bituminous coal (virtually all imported from the United States) in 1971 than in 1970. Relatively small quantities of coal are used for thermal power generation in Nova Scotia and New Brunswick. All other uses, such as for railways, ships' bunkers and for manufacturing plants, continued to decline.

The production and export of metallurgical coal continued to rise. In 1971, export of coking coal to Japan increased to 7.4 million tons from 4.1 million tons in 1970 and this amount is expected to continue to grow. Domestic consumption of imported coking coal decreased to 7.3 million tons from approximately 8 million tons in 1970; this decline is expected to reverse in the future as the demand for steel grows. Production of synthetic fluid fuels from cheaply mined coals is technically feasible and may become viable in the future. Developments in the coal processing industry are dealt with in Section 12.1.5 of the preceding chapter.

13.2.6 Uranium

Canada's proven uranium reserves (about 20% of the world's reserves outside USSR, Eastern Europe and China) should be ample to meet the domestic requirements into the 21st century. With its relatively large reserves and committed production facilities, Canada must look to export markets for uranium especially in the short term, to maintain a viable industry to meet her own requirements in the future.

In 1971 continued world overproduction of uranium and intense competition combined to force uranium prices to an all-time low. The year 1972 saw some improvement in the situation. In November 1972, Denison and Uranium Canada Ltd. confirmed a sales agreement valued at nearly \$60 million, involving 45,000 tons of U_3O_8 . The uranium will be delivered to a group of Spanish utilities over the period 1974 to 1977. The scale was made even before the Canadian government - Denison joint venture stockpile was accumulated and will completely dispose of this stockpile plus part of the government's general stockpile. This development brought total Canadian uranium commitments made since 1966 to over 73,000 tons U_3O_8 of which about 9,500 tons had been delivered by year-end.

Although the uranium industry suffers in the near-term from oversupply, the long-term outlook remains bright as orders for nuclear generating capacity continue to increase

throughout the world. The projected growth of nuclear capacity in electrical output to 1990 is estimated in Table 13.8. Although its share will decrease from 70% to about 50%, the US will probably remain the dominant consumer of uranium, followed by Western Europe and Japan; Canada's share will remain small. By 1990, annual requirements of these countries could reach 220,000 tons of U_3O_8 and cumulative demand to 2 million tons. It seems clear that prospecting and exploration must be accelerated if a shortage of low-cost uranium is not to develop in the 1980s. However, the trend seems to be in the opposite direction. In Canada, exploration has all but ceased, presumably because of the poor short-term market situation with prices of uranium at an all-time low, but should the current low level of exploration persist, there could be a period of uranium under-supply in the 1980s.

13.3 Electric power

13.3.1 Electric power development

While most of the fossil fuels (coal, oil and gas) are extensively employed in a direct form to provide energy, a significant portion is converted into a secondary form of energy, electricity. In the case of coal, more than half of Canada's energy in this form is converted to electricity. Two other primary energy resources, hydraulic energy and uranium, are almost exclusively employed after conversion to electricity. The reasons for employing this energy conversion, and for the sustained growth in electrical energy use in Canada since the beginning of the century, are principally the ease with which energy in the electrical form can be distributed, the flexibility of control and the efficiency of conversion to mechanical power, light, heat and the other end uses. From a modest 133,000 kilowatts of generating capacity installed at the end of 1900, Canada's installed hydro capacity rose to 30,601,000 kw by the end of 1971 and thermal capacity to 16,077,000 kw (Table 13.9).

Thermal-electric power development in Canada was not well documented early in the century but its growth was slow and of relatively minor importance until the late 1940s. The rate of development of hydro facilities, on the other hand, accelerated after the turn of the century when improvements in electric power transmission techniques were introduced and increasing emphasis began to be placed on the construction of large hydro-electric stations.

During the prosperous 1920s demand for electricity became heavier and the rate of installation increased appreciably. Then, in the depressed conditions of the early 1930s, power demand dropped off but this did not show up immediately as a drop in the installation rate because of the time lag inherent in hydro-electric power development. The completion of hydro projects initiated prior to the depression period accounted for the continuation of high rate of capacity installations up until 1935; thereafter, poor economic conditions in the 1935-39 period resulted in a reduced rate.

In the early war years, the tremendous demand for power for Canada's war industries accounted for the sharp rise in installation of new generating facilities between 1940 and 1943, but in the later war years construction dropped off so that, from 1944 to 1947, a second flattening occurred in the growth curve. After the war, industrial expansion and rapidly growing residential and agricultural development placed extremely heavy demands on power generating facilities. To stay abreast of these demands required the installation of new capacity at a rate higher than at any time in Canada's history. This increased demand also led to the start of an extensive program of thermal plant construction in the early 1950s, since hydro sources alone could not possibly satisfy requirements. In 1956, thermal generation represented 15% of installed capacity. Since then, the annual installed capacity has averaged 56% hydro-electric and the remainder in thermal generation. At the beginning of 1972 thermal generation accounted for 34% of Canada's installed capacity.

13.3.2 Current trends

Although water power traditionally has been and still is the main source of electrical energy in Canada, thermal sources will undoubtedly become the main supplier in the future. The choice between development of a hydro-electric power site and construction of a thermal generating station must take into account a number of complex considerations, the most important of which are economic in nature. In the case of a hydro-electric project, the heavy capital costs involved in construction are offset by maintenance and operating costs considerably lower than those for a thermal plant. The long life of a hydro plant and the dependability and flexibility of operation in meeting varying loads are added advantages. Also

important is the fact that water is a renewable resource. The thermal station on the other hand can be located close to the demand area, with a consequent saving in transmission costs. However, with the current trend to large steam stations a certain amount of the flexibility of location of thermal stations is lost because such units require considerable quantities of water for cooling purposes, making it essential that they be sited close to an adequate water supply.

The marked trend to thermal development which became apparent in the 1950s can be explained in part by the fact that most of the hydro-electric sites in many parts of Canada within economic transmission distance of load centres had been developed by that time and planners had to turn to other sources of electrical energy. More recently, however, advances in extra-high-voltage transmission techniques have provided a renewed impetus to the development of hydro power sites once considered too remote.

Thermal power generation may use fossil fuels or nuclear fuels as the source of energy. The fossil fuels — coal, gas or oil — can be obtained economically from domestic sources in some parts of Canada. In other regions the cost of transportation leads to the use of imported fossil fuels. Nuclear fuels are providing an increasingly important source of energy for thermal power plants and will be especially attractive for regions where fossil fuel costs are relatively high and where the power system permits the use of very large generating units which show the best economic advantage for nuclear plants. The CANDU reactor system, which provides the heat source for Canadian nuclear plants, allows the use of natural uranium mined and processed in Canada.

Because of the relatively long starting-up time required by large thermal units, such stations tend to lack flexibility of operation and can be used most efficiently to meet continuous load conditions. Hydro stations, on the other hand, can put generating units on line with minimum delay and hence are admirably suited to supply power to meet peak loads which may occur several times each day. This applies mainly to hydro plants located close to load centres where peaking operation does not involve substantial extra transmission costs. By combining the advantages of both hydro and thermal stations in integrated supply systems power producers are now achieving much greater flexibility of operation.

Another development trend designed to meet the problem of varying daily loads is the use of pumped storage. An example is the Sir Adam Beck hydro development at Niagara Falls where water taken from the Niagara River above the Falls is carried by tunnel and power canal to penstocks which supply the main generating station on the bank of the Niagara River some distance below the Falls. In off-peak hours, power from the main station is used to pump water from the power canal into a reservoir maintained at a higher level; during peak-load hours, the dual-purpose pumps operate as generators and are driven by water released from the reservoir. The pumping-generating units at this development make available an extra 176,700 kw of generating capacity. A pumping-generating station using the same general principle has been constructed on the Brazeau River in Alberta as part of the 305,500-kw Big Bend hydro development.

Perhaps the most promising application of the pumping-generating principle is its use in conjunction with nuclear power stations. Nuclear units, in common with the larger conventional thermal units, can be used most efficiently under conditions of continuous operation. Off-peak nuclear power can be used to operate pump-turbine units and the hydro-electric power derived from operating the units as generators is available for use during periods of peak demand.

Details of research activities now being carried on into the many aspects of electric power generation and distribution in the broad sense may be found in Chapter 9.

13.3.3 Utilization of electrical energy

In 1971, Canada's generating facilities produced 215,064 million kilowatt-hours of electrical energy, after allowing for the energy used in the power stations themselves. Of this total, 74.6% was produced in hydro-electric stations and the remainder in thermal stations. Electric power exported to the United States exceeded imports by 3,737 million kwh during 1971, so that the total energy available in Canada amounted to 211,327 million kwh.

As indicated in Table 13.10, total electrical energy consumed in Canada during 1971, after deducting about 8% for losses, was divided among commercial users (15%), domestic and farm consumption (21%) and industrial loads (56%). The energy distribution for this latter group can be subdivided approximately as follows: one third to the mineral industry (including smelting

Installed generating capacity in Canada, 1950-71

and refining), one quarter to the pulp and paper industry, one tenth to chemical manufacturing and the remaining portion to all other industrial categories. The availability of electrical energy, at reasonable cost, is an important element in Canada's industrial growth.

For a few industries the cost of electric power is a key element in economic competitiveness. For most industries, however, electrical energy is but one of many cost elements which influence the opportunities for expansion. The assurance of a reliable supply of electrical energy, the availability of assured supplies to meet the needs of growing demand without delay, and attention to the many other factors influencing industrial development will normally be a more effective element in industrial growth than one which assumes that "low cost power" is an essential or sole ingredient for success.

Over the past two decades, the portion of the country's total electrical energy consumed by industry has dropped appreciably (from 67% in 1950 to 56% in 1971) while consumption by other sectors has risen significantly. This is not to say that there has been an actual decline in industrial demand, but rather that industrial expansion has been less energy-intensive and there has been a more rapid growth by the other users. Domestic and farm consumption has shown the highest increase, from 13% of the total in 1950 to 21% in 1971. Commercial consumption has also risen noticeably, from only 11% in 1950 to 15% in 1971. The growth among non-industrial customers results from a greater reliance by Canada's population on facilities powered by electricity. Tremendous quantities of electrical energy are required, for example, to meet rapidly escalating demands for heating, cooling, lighting, transportation, elevators, electrical appliances and farm machinery. The shift of population from rural areas to cities and towns, where electrical demand is greatest, has also been a contributing factor to this growth.

Details of the provincial pattern of electrical energy use can be seen in Table 13.11. Of total energy made available in Canada during 1971 more than two thirds was consumed in

Ontario and Quebec with the remaining one third shared by all other regions. The share of total consumption by these other regions has, however, been rising (combined total of 26% in 1960 compared to 33% in 1971) while it has been declining in Quebec (40% in 1960 as against 33% in 1971) and has remained constant in Ontario at 34%. In all parts of Canada industrial users have been and still are the prime consumers. The actual portion of total energy consumed by industry in 1971, for instance, ranged from a high of 64% in British Columbia, which includes the energy used in both the Yukon and Northwest Territories, to a low of 47% in the Prairie region. Domestic and farm consumption remains greatest in the Prairie Provinces and Ontario but for somewhat different reasons. In Ontario, where the majority of people are urban dwellers, it is the high demand from the large cities that accounts for the higher level, while in the Prairies it results from a substantial farming load combined with a normal level of domestic usage.

Part of Canada's growing need for electric power reflects a growth in population but in addition the consumption per capita increased in 1971 by 4.2% to 9,800 kwh per capita. Since 1960 consumption per capita in Canada has risen by more than 60%. The Atlantic Provinces experienced the largest increase, 154% to 6,600 kwh per capita, followed closely by the Prairie Provinces with 132% to 7,200 kwh. The lowest increase over the period was in Quebec with only a 36% rise to 11,700 kwh per capita but the level was already very high. British Columbia recorded the highest per capita consumption in 1971, 12,800 kwh. Table 13.12 sets out details of this per capita consumption by region.

Electrical energy generated in Canada during the year was equivalent to 52.7% of the amount which in theory could be generated if the total installed capacity at the end of 1971 were operating continuously. The balance reflects fluctuations in load below peak demand during daily and seasonal cycles together with reserves of generating capacity.

13.3.4 Hydro-electric power generation

As discussed in Section 13.3.2, hydro-electric generation will play a decreasing, yet significant role in Canada's future electrical development. By the beginning of 1972, the hydro portion of the country's total generating capacity had fallen to 66% from over 90% twenty years earlier.

In view of the vast water resources existing throughout Canada, there would appear to be many undeveloped sites that could be potential sources of hydro-electric power. It is not sufficient, however, to assume that all of these possibilities represent economically viable sources of electric power. In fact, only a very minor portion of the sites with a theoretical power potential can actually be developed competitively. Before a site can be termed a source of potential power, a detailed analysis of such factors as costs, geography, geology and ecology must be performed. Until a study is completed on a national scale, estimates of Canada's undeveloped water power resources may tend to be misleading; a recent estimate places them in excess of 60 million kw.

Figures of water power resources already developed are given in Table 13.9 and are based on the manufacturer's rate in kilowatts as shown on the generator name-plate, or derived from the rating where it is indicated in kilovolt-amperes. The maximum economic installation at a power site can be determined only by careful consideration of all the conditions and circumstances pertinent to its individual development. It is normal practice to install units having a combined capacity in excess of the available continuous power at Q50 (flow available 50% of the time), and frequently in excess of the power available at Qm (arithmetical mean flow). There are a number of reasons for this. The excess capacity may be installed for use at peak-load periods, to take advantage of periods of high flow, or to facilitate plant or system maintenance. In some instances, storage dams have been built subsequent to initial development to smooth out fluctuations in river flows. In other cases, deficiencies in power output during periods of low flow have been offset by auxiliary power supplied from thermal plants, or by interconnection with other plants which operate under different load conditions or are located on rivers with different flow characteristics.

The extent to which the installed capacity exceeds the available continuous power at the various rates of flow is dependent upon the factors that govern the system of plant operation, and varies widely in different areas of the country.

The provincial and territorial distribution of installed hydro-electric generating capacity given in Table 13.9 reveals that substantial amounts of water power have been developed in all

provinces except Prince Edward Island. As natural resource development proceeds, the fortunate incidence of water power in proximity to mineral, forest and other resources becomes increasingly apparent. The existence of large amounts of potential hydro power on northern rivers may well prove to be a factor of prime importance in the eventual realization of the natural wealth of the Canadian North.

The water power resources of Nova Scotia and New Brunswick, although small in comparison with those of other provinces, are a valuable source of energy and make a substantial contribution to the economies of the two provinces. Numerous rivers in both provinces provide moderate-size power sites either within economic transmission distance of the principal cities and towns or advantageously situated for use in development of the timber and mineral resources. These provinces have, however, turned to coal-fired thermal generation and are increasingly utilizing oil.

13.3.5 Thermal power generation

The incidence of immense water power resources in Canada and the brisk pace of their development has tended to overshadow the very considerable contribution being made by thermal energy in the nation's power economy. At the end of 1971, the total installed thermal capacity in Canada was 16,077,000 kw, representing about 34% of the total electric generating capacity in the country. The fact that energy produced in thermal plants during the year accounted for only 25% of the total may be attributed in part to the fact that a considerable amount of the capacity installed is operated for peak-load duty, with hydro-electric capacity providing base-load generation. This pattern will change with the introduction of additional nuclear-fuelled thermal generation plants which can be operated economically at high capacity factors for base-load purposes.

Conventional thermal power. Over 90% of all thermal power generating equipment in Canada is driven by steam turbines. The magnitude of loads carried by steam plants combined with the economies of scale has led to the installation of steam units with capacities as high as 540,000 kw, and units in the 800,000-kw size range have been committed for as early as 1975. Additions of these larger units are, however, only possible where systems are large enough to accommodate them. Additional types of thermal generation are provided by gas turbine and internal combustion equipment. The flexibility of internal combustion engines makes this type of equipment particularly suitable for meeting power loads in smaller centres, especially in the more isolated areas. Gas turbines are frequently used for peak loads where their rapid start-up ability is an advantage.

Table 13.9 shows that thermal generation is predominant in Prince Edward Island and Nova Scotia. By the end of 1971, the Yukon Territory had joined the Northwest Territories, Alberta, Saskatchewan, Ontario and New Brunswick in having greater than one half of their total capacity thermal-electric. It is expected that thermal generation will become increasingly predominant in Ontario. Although coal is still the most important fossil fuel for thermal plants in Nova Scotia, oil is rapidly becoming the preferred choice for thermal power generation in all of the Atlantic Provinces.

Nuclear thermal power. Commercial electric power generated from the heat of nuclear reaction became a reality in Canada in 1962 when the 20,000-kilowatt electrical (kwe) Nuclear Power Demonstration station at Rolphton, Ont., fed power for the first time into a distribution system in Ontario. The NPD station is the forerunner in a series of large nuclear stations that will shoulder more and more of Canada's rapidly growing power loads.

Research into reactor design and the application of nuclear energy in the electric power field are among the more important responsibilities of Atomic Energy of Canada Limited, a Crown company incorporated in 1952 (see also Chapter 9). AECL has concentrated its efforts on the development of the CANDU reactor which uses natural uranium as a fuel and heavy water as the moderator. By using heavy water as the moderator, a high energy yield can be obtained from natural uranium and, since natural uranium is a low-cost nuclear fuel, the cost of fuel is a minor component in the cost of producing power. Natural uranium has the added attraction of being available in commercial quantities in Canada.

The NPD station has been used extensively to demonstrate the ability of the system to operate at a high capacity factor and to determine the nature and predictability of outages. Fuel changes while the system is in operation have become routine and a considerable amount of research into the sources of heavy-water losses has been carried out. As a result of this research, losses have been cut down and the NPD station is demonstrating that a very acceptable heavy-water loss rate is attainable. The station was modified in 1968 to a boiling heavy-water mode of operation to provide additional demonstration capabilities.

At Douglas Point on the shore of Lake Huron, the country's first full-scale nuclear power station went into commercial production in 1967. The station, built with the co-operation of Ontario Hydro, houses a 220,000-kwe CANDU reactor. Experience gained in the design and operation of this reactor has encouraged the development of even larger units. Construction of the four-unit, 2,160,000-kwe Pickering nuclear station is well advanced near Toronto, with two of the station's four units coming on line ahead of schedule during 1971; units 3 and 4 were expected to go into service in 1972 and 1973. Work on the Bruce nuclear station for Ontario Hydro is proceeding with four 800,000-kwe units planned for installation from 1975 to 1978.

A further step in the development of the CANDU reactor is the use of boiling light water instead of pressurized heavy water as the coolant. Quebec's Gentilly nuclear station near Trois-Rivières utilizes boiling light water in its CANDU reactor. This station came into service in 1971 with 250,000 kwe of nuclear-electric capacity.

13.3.6 Electric power transmission

The nature of the loads handled by small, widely scattered generating systems in the early days of the electric power industry in Canada did not warrant the expense of interconnecting power systems. However, as the demand for dependable electric power increased and improved techniques reduced power transmission costs, the benefits of integrating power systems to achieve reliability of service and flexibility of operation were re-appraised. Today, most of Canada's generating stations are components of large, integrated and often interconnected power systems operated by power utilities and companies in the various provinces.

Constant research in the field of power transmission has developed techniques that enable power producers to utilize hydro-electric sites previously considered beyond economic transmission distances. Most noticeable, perhaps, is the progressive stepping-up of transmission-line voltages. In Canada, there are a number of transmission lines designed for operation at 500,000 volts and 735,000 volts. A 574-mile, 500,000-volt line is in service to carry power from the Peace River to the lower mainland of British Columbia. In Ontario, a 435-mile, 500,000-volt line carries power from hydro-electric plants in the James Bay watershed to Toronto. In 1965, Hydro-Quebec achieved world leadership when power was carried for the first time at 735,000 volts over the 375-mile transmission line between Quebec's Manicouagan - Outardes hydro complex and the cities of Quebec and Montreal. By the end of 1971, the initial program for 1,228 miles of the 735,000-volt line had been completed. Work also finished on the first of three additional 735,000-volt circuits to connect the Churchill Falls complex with the Hydro-Quebec grid.

Most power is transmitted as alternating current but three applications of high-voltage direct-current (HVDC) are found in Canada. In service in British Columbia is a 260,000-volt HVDC link from the mainland to Vancouver Island. It has a capacity of 312,000 kw and includes 21 miles of undersea cable; it is a monopolar system using the ground as the return path for current. A second HVDC system is expected to be placed in service in 1973 linking the Kettle generation station on the Nelson River to Winnipeg where two 555-mile lines have been completed and converter equipment is now being installed. The initial capacity is 810,000 kw and the planned ultimate rating is 3,200,000 kw. Another application is designed to provide a non-synchronous tie between the systems of New Brunswick and Quebec; this is a 320,000-kw back-to-back HVDC system located at Eel River, NB, which was placed in service in 1972 employing solid state thyristor valves in place of the mercury arc valves used for the earlier HVDC systems.

Interconnections of from 66,000 to 230,000 volts exist between British Columbia and Alberta, Saskatchewan, Manitoba, Ontario and portions of the Quebec system are interconnected and, through the Ontario Hydro system, are linked with the northeastern United States systems. Quebec, New Brunswick and Nova Scotia systems are interconnected. The first international tie connecting regions of the Maritimes in Canada with the United States became a reality during 1970 on completion of a 345,000-volt link between the New Brunswick and Maine systems. British Columbia has an international tie with the Pacific Northwest (500,000 volts) and a 230,000-volt link between Manitoba and the United States was completed during 1970.

The search for economies in transmission systems has led to changes not only in materials used but also in tower erection and cable-stringing methods. Guyed V-shaped and Y-shaped transmission towers are being used increasingly in place of self-supporting towers where the terrain is suitable, and erection costs are being reduced by the use of helicopters to transport tower sections to the site for assembly. The use of helicopters for spraying for brush control on the right-of-way and for line inspection and maintenance is wide-spread.

In addition to considering the economics of transmission development, a concerted effort is under way to provide systems that are acceptable aesthetically. For example, designing more attractive towers led to the development of new tapered aluminum poles which will ultimately replace their unsightly wooden counterparts. Discretion is also being exercised in the selection of routes for proposed lines to ensure only minimal disturbance of the natural landscape.

13.3.7 Developments in 1971

Net additions of 3,862,000 kw to electrical generating capacity in 1971 raised Canada's total installed capacity by 9% to 46,678,000 kw. Reversing the 1970 growth pattern where thermal additions predominated, hydro-electric capacity accounted for 2,308,000 kw or nearly 60% of all 1971 installations. The 1,554,000 kw of thermal capacity added provided only 40% of the 1971 total compared to 1,810,000 kw or 59% of the total in the previous year. With the installation of the first two 540,000-kw units at Ontario Hydro's Pickering station and the commissioning of the 250,000-kw Gentilly station by Hydro-Quebec during the year, the country's nuclear generating capability rose an unprecedented 554% to 1,570,000 kw (from 240,000 in 1970). In fact, nuclear additions provided more than 85% of the over-all thermal-electric installations made in 1971. As at December 31, 1971, total installed capacity was approximately 66% hydro-electric, 31% conventional thermal and 3% thermal nuclear.

The trend to larger unit sizes which has been evident in the past few years continued in 1971. Of the 1,554,000 kw of thermal capacity installed, 1,480,000 kw or 95% was contributed by units of 150,000 kw or greater. In hydro-electric additions, where size is largely affected by hydraulic conditions, there were 1,812,000 kw or nearly 80% in units of the 150,000-kw, or greater, size range.

Although the 4,500,000 kw of new capacity predicted to be placed into service during 1971 were not attained, the 3,862,000 kw which were installed established an all-time high for capacity additions in a single year. The previous record of 3,840,000 kw was set in 1969. In 1970 less than 3,100,000 kw of new generating capacity were added.

Electrical energy generated in Canada in 1971 increased by 5.7% to 216,472 gigawatt hours (gwh) (million kilowatt hours). Exports of energy to the United States rose appreciably (30% over 1970) to 7,321 gwh or slightly more than 3% of total generation. With 3,378 gwh of energy being imported from the US, net exports at year-end stood at 3,943 gwh (58% above the 1970 net export). The actual growth of primary and secondary energy supplied within Canada, therefore, was up only 5.0% to 211,271 gwh. The 5.0% increase is substantially below the 6.7% average growth rate for the 1961-71 period.

In 1971, energy generation from thermal units continued to show the more substantial increase — 15.2%, compared with a modest 2.6% rise in hydro generation. A significant rise was experienced in steam generation, both nuclear (312%) and conventional (10%), while there was a considerable decrease in internal combustion (–5%) and gas turbine (–29%) generation. The share of total energy supplied by hydro-electric facilities fell from 76.7% (156,276 gwh) in 1970 to 74.6% (160,412 gwh) in 1971.

The portion of energy generated by electric utilities during the year was approximately 85%, up from about 84% in 1970; such a growth pattern will likely continue. The only provinces where industrial power generation still plays a significant role are British Columbia and Quebec, with 41% and 21%, respectively, of the total electricity in those provinces being generated by industry. In Manitoba and Prince Edward Island all major power generation comes from electric utilities.

13.3.8 Generating capability and load requirements

Power generating *capability* is the measurement of the available generating resources of all hydro and thermal facilities at the time of the one-hour firm peak load for each reporting company, and is not equal to the *capacity* of such generating facilities. For example, a hydro plant may have a capacity of 100,000 kw but if, at the time of peak load, the water available for generation is only 80% of the plant capacity requirements, then its capability is 80,000 kw.

Total generating capability has grown at a rapid rate especially in the past few decades. The annual rate of increase was 7.0% in the period 1961-71 and 9.3% in the period 1967-71. In comparison, the forecast rate of growth for the years 1972-76 is 7.3%; thermal generating capability is expected to grow at an average rate of 10.7% a year in the forecast period compared with 13.3% in the period 1961-71, and hydro-electric capability is expected to increase at 5.3% a year compared with 4.4% in the 1961-71 period. This rate of growth in hydro generating capability in the forecast period is attributable to the large power projects under construction in relatively remote areas that will be completed within the next few years. More specific information can be found in Table 13.13.

Among the provinces, Ontario has the largest generating capability, followed by Quebec, British Columbia and Alberta. Quebec has the largest hydro-electric generating capability, followed by Ontario and British Columbia, but Ontario has the largest thermal capability, followed by Alberta and British Columbia. The first full-scale nuclear power station went into commercial operation in Ontario in early 1967.

The largest absolute growth in generating capability for the forecast years is indicated for Ontario at 6,889,000 kw, followed by Newfoundland at 3,666,000 kw, British Columbia at 2,835,000 kw and Quebec at 1,327,000 kw. Ontario will meet most of its increased generating capability by adding 2,835,000 kw in thermal capability and 60,000 kw in hydro capability, the former including 60,000 kw nuclear. Newfoundland will add 3,663,000 kw hydro and 3,000 kw thermal, and British Columbia 2,493,000 kw hydro and 342,000 kw thermal.

Firm power peak load is the measure of the maximum average net kilowatt demand of one-hour duration from all loads, including commercial, residential, farm and industrial consumers as well as the line losses. Such load demand increased at the rate of 6.9% a year from 1961 to 1971 and 6.5% a year from 1967 to 1971; peak-load demand is forecast to increase at the

average rate of 7.3% a year in the period 1971-76. As a result of the rapid increase in generating capability and the somewhat slower but steady increase in the peak loads, together with the slight reduction in deliveries of firm power to the United States, the indicated reserve on net capability in the 1961-71 period increased each year except 1961, 1963, 1964 and 1966. Increases are forecast for each year from 1971 to 1976. The reserve ratio as a percentage of firm power peak load reached a high of 28.2% in 1960 and fell to 13.7% in 1968 but is expected to increase to 24.2% in 1976. Absolute figures are given in Table 13.14.

13.3.9 Electrical utilities

Federal government regulation of electrical utilities with respect to the export of electric power and the construction of lines over which such power is exported falls within the jurisdiction of the National Energy Board.

Power is generated in Canada by publicly and privately operated utilities and by industrial establishments. Over 75% of the total electric power generated in 1971 was produced by publicly operated utilities, 10% by privately operated utilities and 15% by industrial establishments. However, ownership varies greatly in different areas of the country. Although Quebec power installations were at one time privately owned, almost all were transferred to public ownership in 1963. In Ontario almost all electric power has been produced by a publicly owned utility for over 60 years.

Because the determination of market prices and regulation of services is limited to inter-fuel competition with oil, gas and coal, some regulation of electrical utilities has been attempted in all provinces. In most of them the generation and main transmission of power is the responsibility of a provincial Crown corporation. Investor-owned electrical utilities are predominant in Alberta and play a significant role in Newfoundland, Prince Edward Island, Ontario and British Columbia; they contribute about 10% of the total power generated in each province. Generating facilities in industrial establishments represented 11.4% of installed capacity at the end of 1971 and generated 15.0% of the electrical energy produced during the year. There is an annual decline in industrial generation as it becomes increasingly attractive to purchase power from utilities, which can take fuller advantage of larger unit sizes and operational flexibility. Even when process steam is required for an industrial operation, there are instances when it is advantageous to purchase both steam and power from the electrical utility.

Newfoundland. The Newfoundland and Labrador Power Commission was established in 1954 to supply power wherever needed throughout the province. The Commission began large-scale production of electrical energy in 1967 when the Bay d'Espoir plant began operating and the provincial transmission grid was established. Power is supplied from this grid to several industries direct and to investor-owned electric distribution companies for distribution. The Newfoundland Light and Power Company is the principal distributor. Bowater Power Company Limited supplies the Bowater Newfoundland Pulp and Paper Mills Limited and several large mining operations. Electricity is provided to isolated areas through Rural Electricity Authority and Power Distribution Districts, principally through diesel generator sets. In Labrador, the Churchill Falls (Labrador) Corporation, a subsidiary of Brinco, is engaged in the development of the massive Churchill Falls power project which commenced production in 1972. This company also controls the Twin Falls Power Corporation which serves iron ore mining centres in western Labrador.

The water-power resources of this province are very substantial. On the island, although the rivers are generally not long, topography and run-off favour hydro-electric power development; of the substantial capacity installed, a very large portion serves the pulp and paper industry.

In Labrador, the Churchill River and its tributaries, now under development, constitute one of the largest potential sources of water power in Canada. An important milestone was passed during 1971 at the massive Churchill Falls complex in Labrador with installation of the first two 475,000-kw hydro-electric units. First power was delivered to Hydro-Quebec over the first of three 735-kv transmission lines late in the year. Although the complex was originally scheduled for completion in 1976, the construction program is being accelerated and it is now expected that the project will be completed by the end of 1975. At that time, Churchill Falls will be by far the largest generating station in Canada and, indeed, one of the largest in the world.

Thermal capacity in Newfoundland had, until recently, consisted of small internal combustion stations serving more isolated communities, together with a few medium-sized gas turbine and steam turbine units in larger centres. The province's first major thermal station, the 300,000-kw oil-fired steam generating plant at Holyrood, was completed during 1971 with installation of the second 150,000-kw unit. Located a few miles outside St. John's, Holyrood now provides almost 70% of the province's total thermal generating capability and, in fact, is second only in rated capacity to the Bay d'Espoir hydro-electric station on the Salmon River. With more than 450,000 kw of new capacity installed on the island in the 1970-71 period, neither of the province's major utilities, the Newfoundland and Labrador Power Commission and the Newfoundland Light and Power Company, anticipates any additions for at least the next two to three years.

A major problem facing the Newfoundland and Labrador Power Commission has been the distance separating the rapidly expanding industrial load on the west coast and the major source of power generation at Bay d'Espoir. However, work is expected to begin soon on a second 230-kv line to connect Bay d'Espoir with the Bottom Brook substation near Stephenville. Completion of various sections of this line are set for 1973, 1976 and 1978. The only additions to the island's transmission network during 1971 were made to the 66-kv and 230-kv systems and were very minor in nature.

Prince Edward Island. The absence of any large streams in the province has led to an almost total dependence on thermal-power generation except for a few plants used to operate small mills. The Maritime Electric Company, Limited provides direct service to customers in Charlottetown and in the towns, villages and rural areas of the province with the exception of Summerside, where a municipal electric department serves customers with power purchased from the Company while the town's 6,900-kw diesel plant is on stand-by.

Addition of a new 14,000-kw gas turbine unit at Borden during 1971 increased the province's total generating capacity by 18%. About 14 miles of 138-kv transmission line were erected to connect the Borden plant with the existing 69-kv transmission system at Summerside.

Sharp increases in electric power rates were experienced in PEI during the year as a result of an 80% increase in the price of bunker "C" fuel used in the 70,500-kw Charlottetown steam plant which provides more than three quarters of the province's generating capacity. Renewed consideration is now being given by Maritime Electric to the economic and operational advantages of a cable interconnection to the mainland which was studied several years ago by the Atlantic Development Board but not implemented when construction of a planned causeway to the mainland was rejected. The company supplied 274,909,536 kwh to all customers in 1972 for an increase of 12% over 1971 and had an installed capacity of 84,500 kw.

Nova Scotia. The self-supporting Nova Scotia Power Commission, with total assets of \$395 million, is one of the province's largest industries. It was created by Act of the provincial legislature in 1919 to develop the limited but useful hydro potential of the province, and to control exploitation of its rivers. Its first objective was to develop remote hydro sites to supply low-cost energy to new industries, particularly pulp and paper, and to a few centres of population. In 1937 this emphasis was changed when the Rural Electrification Act made it possible, through equalization grants, to bring power to low-density farm and rural village areas.

Throughout the 1960s, the Commission acquired a number of small electric utilities, and in 1972 it purchased the Nova Scotia Light and Power Company Limited. The Commission and its subsidiaries employ about 2,200 full-time personnel to serve some 250,000 customers. As at December 31, 1972, the Commission had a total installed capacity of 958,000 kw in 32 hydro and seven thermal stations. About 75% of this capacity is, however, in the thermal stations, with hydro furnishing the balance. Most of the province's economic hydro potential has been exploited. Vast energy potential exists at several sites on the Bay of Fundy and studies are now under way to determine the economic feasibility of using this tidal power. Except for such developments, future expansion in Nova Scotia will be concentrated on expanded thermal generating facilities. Firm commitments include a 100,000-kw addition to the Tuft's Cove plant scheduled to go into service in 1972 and a 150,000-kw unit addition to the Point Tupper station which should be on line by the end of 1973. Although definite plans have not yet been completed, most new capacity to be added beyond 1973 will probably be centred

around the Point Tupper station; smaller gas turbines will be used for security and peaking in more isolated areas.

The 43,000 kw of new generating capacity added during 1971 came from an 18,000-kw oil/wood-fired unit installed at the Port Hawkesbury station of Nova Scotia Forest Industries and from a 25,000-kw gas turbine unit commissioned by the Nova Scotia Power Commission at Tusket, near Yarmouth. Installed primarily to handle peak loads, this unit will also provide additional security to the power system in the western end of the province. A 3,000-kw steam plant at Sydney Steel Corporation Ltd. was removed from service in 1971.

The Nova Scotia transmission network was extended by about 100 circuit miles during 1971. Construction is under way on a second major line, due for completion by 1973, linking the Canso Strait area to Sydney.

New Brunswick. The New Brunswick Electric Power Commission was incorporated under the Electric Power Act of 1920. It has maintained a steady growth pattern since 1969. Power generation has risen from 4,196,000,000 kwh in 1970 to 4,748,000,000 kwh in 1971 and 5,894,000,000 kwh in 1972 for a corresponding capital investment of \$389.5, \$405.1 and \$452.4 million.

Generating stations owned by the Commission at December 31, 1972 were: Grand Falls (hydro) 63,000 kw; Tobique (hydro) 20,000 kw; Beechwood (hydro) 115,000 kw; Milltown (hydro) 3,900 kw; Sisson (hydro) 10,000 kw; Courtenay Bay (steam) 263,365 kw; Grand Lake (steam) 98,750 kw; Saint John (steam) 16,000 kw; Chatham (steam) 32,500 kw; Grand Manan (diesel) 2,811 kw; Mactaquac (hydro) 400,000 kw; and Dalhousie (steam) 100,000 kw. The total installed capacity was 1,150,326 kw.

With the exception of Grand Manan, these generating units are interconnected in a province-wide grid system. High-capacity interconnections with neighbouring utility systems in Quebec, Nova Scotia and New England are also available. System load increases during the early part of this decade are being met with base-load power purchased from Hydro-Quebec and with peaking power from hydraulic stations on the Saint John River system in addition to existing thermal stations.

New Brunswick's installed generating capacity was increased by 25,000 kw during 1971 when a new gas turbine peaking unit at Moncton was commissioned. The province's system was further expanded in April 1972 when the fourth 100,000-kw unit at the Mactaquac hydro-electric station was brought on line. Two additional 100,000-kw units to be added later at Mactaquac will bring the plant's over-all capacity to 600,000 kw. Studies are under way to determine the optimum timing for these remaining two units.

A new oil-fired thermal generating station is being constructed at Coleson Cove near Lorneville in the Greater Saint John area. Although the station will consist initially of two 300,000-kw steam units, a third unit of similar size may be added later. The first two units are expected to be brought on line in 1975 and 1976 when the present agreement to purchase power from Hydro-Quebec terminates. A new source of power will be urgently required at that time.

A unit participation agreement to provide for the export of 400,000 kw of Coleson Cove's 600,000 kw to the United States has been submitted to the National Energy Board for approval.

The possibility of developing additional storages on the Saint John River and of increasing the installed capacity at Grand Falls is being reviewed. Nuclear generation in New Brunswick within the next decade is also a definite possibility.

Quebec. The richest of all provinces in water power resources, Quebec possesses about 40% of the total for Canada; and leads in developed water power with installations of 13,766,000 kw in 1971, representing about 45% of the national total. Power production in the province is facilitated by the regulation of stream flow through storage dams owned and operated by the Department of Natural Resources. Some responsibility for regulation rests with the Quebec Hydro-Electric Commission.

The Quebec Streams Commission created in 1910 was authorized to ascertain the water resources of the province, to make recommendations regarding their control and to construct and operate certain storage dams to regulate the flow of streams. In 1955, the Commission was abolished and its functions transferred to the Hydraulic Resources Department, now the Department of Natural Resources. The rivers controlled by the Commission either by means

of dams on the rivers or by regulating the outflow of lakes at the headwaters, were: the St. Maurice, the Gatineau, the Lièvre, the St. Francis, the Chicoutimi, the Au Sable and the Métis. The Commission also operated nine reservoirs on the North River, two in the watershed of the Ste. Anne de Beaupré River and one at the outlet of Lake Morin on Rivière du Loup. Eleven auxiliary reservoirs on the St. Maurice system and two on the Gatineau were turned over by the Department of Natural Resources in 1965 to the Quebec Hydro-Electric Commission for operation and maintenance. Other storage reservoirs include: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River, the Onatchiway on the Shipshaw River and Lake Memphremagog on the Magog River, all under private control; and Témiscamingue and Quinze Lakes on the Ottawa River controlled by the federal Department of Public Works. Storage reservoirs controlled by Hydro-Quebec include: Témiscouata Lake on the Madawaska River, Kipawa Lake and Lac Dozois on the Ottawa River, Lac Cassé in the Bersimis River watershed and Lac-Ste-Anne on the Toulouste River, a tributary of the Manicouagan.

The abundance of Quebec's water-power wealth, much of it in reasonable proximity to existing demand areas, has limited the application of thermal power to specific local use. With new developments in transmission technology allowing economic long-distance transportation of large blocks of power, it seems likely that Quebec will continue to concentrate on hydro-electric power and to develop some of the more remote rivers such as those flowing into James Bay. Nevertheless, the province is beginning to look toward thermal power since it will serve not only to help guarantee an adequate power supply in the face of increasingly heavy demands but also to render the almost exclusively hydro-electric base more flexible through integrated operation. Quebec's largest conventional thermal plant, the Tracy station near Sorel, has an installed capacity of 600,000 kw.

The total thermal capacity of the province increased by more than 30% during 1971. The commissioning of the new 250,000-kw Gentilly nuclear station, located on the south side of the St. Lawrence River a few miles downstream from Trois-Rivières, was largely responsible for this sizable increase. Although the station is currently owned by Atomic Energy of Canada Limited, Hydro-Quebec holds an option to purchase the facility when it becomes fully operational. The success in bringing Gentilly on line is of particular interest since it marks the first time in Canada that a nuclear plant using natural uranium as fuel, and ordinary light water for cooling, has produced electric power. All other Canadian nuclear developments use heavy water for cooling. The only other noteworthy thermal addition in the province during 1971 was a 3,000-kw internal combustion unit installed at the Cap-aux-Meules station on the Magdalen Islands. The over-all capacity of this station now stands at just under 15,000 kw.

With the installation of the final three 161,500-kw hydro-electric units at Manic 5, Hydro-Quebec completed the fifth of seven planned developments on the Manicouagan - Outardes river system. When all seven plants are operational they will have a total combined capacity of 5,500,000 kw, of which 3,880,000 kw have thus far been attained. Manic 5, boasting a capacity of 1,292,000 kw, is the largest plant in the complex and the second largest in the province. The Beauharnois development on the St. Lawrence River remains the largest in the Quebec system with a total capacity of more than 1,574,000 kw.

Although not located within the boundaries of the province, the Churchill Falls development in Labrador represents a new and very important source of energy for Quebec. By the end of 1971, two of the projected eleven 475,000-kw units were operational and delivering power to Hydro-Quebec. The Churchill Falls complex is expected to attain full capacity (5,225,000 kw) by the end of 1975 and most of its output will be fed into the Quebec system under a 65-year contract with the developers, Churchill Falls (Labrador) Corporation.

The Quebec Hydro-Electric Commission was established in 1944 (SQ 1944, c.22) to supply power to municipalities, industry, commercial ventures and the general public at the lowest rates consistent with sound financial administration. On May 1, 1963, the Commission acquired control of the following privately owned electrical utilities operating in the province: Shawinigan Water and Power Company, St. Maurice Power Corporation, Quebec Power Company, Southern Canada Power Company, Gatineau Power Company, Northern Quebec Power Company, Saguenay Electric Company, and Lower St. Lawrence Power Company. As a result of these acquisitions, all electricity production, except for facilities operated by certain industrial organizations in their own manufacturing operations, was brought under the control

of a single authority. The Commission now services virtually the entire province except for local distribution of small amounts of electricity by some municipalities, most of it purchased from the Commission or its subsidiaries.

At the end of 1971, Hydro-Quebec and its subsidiaries operated 53 hydro-electric stations with a capacity of 10,439,761 kw and 16 thermal-electric stations with a capacity of 666,949 kw, for a total capacity in operation of 11,106,710 kw to provide a balanced distribution of power throughout the province.

As at December 31, 1971, Hydro-Quebec employed 12,245 persons to serve 1,895,488 customers. Capital expenditures increased from \$291.1 million in 1970 to \$387.6 million in 1971, while the value of plant and properties at cost rose to \$4,662.1 million in 1971 as compared with \$4,287.7 million one year earlier. Available power increased from 51,058 million kwh in 1969 to 56,166 million in 1970 and again to 58,334 million in 1971. Peak system load in 1971 reached 9,173,000 kw, an increase of 3.3% over the preceding year.

Most of the major planned additions to the power system in Quebec are hydro-electric. Next scheduled for service is a 36,600-kw addition to the Rapide-des-Îles plant in 1973 to be followed by the 1,176,000-kw Manic 3 development in 1975-76.

Considerable work took place during the year on the James Bay hydro-electric development. Under the direction of Hydro-Quebec and a number of other companies and consulting firms, approximately 1,300 men supported by 20 helicopters and 15 float-planes undertook a comprehensive survey of the area. Massive amounts of hydrologic, geographic, topographic and other data were needed to determine the feasibility of developing the region. In December, Hydro-Quebec and the James Bay Development Corporation received three reports dealing with the various development possibilities of the rivers flowing into James Bay from the Quebec side and the estimated cost of each. The five major rivers studied were the Nottaway, Broadback, Rupert, Eastmain and La Grande. Hydro-electric potential of the region is estimated at some 15,000,000 kw, roughly three times the size of the Churchill Falls complex.

Hydro-Quebec also carried out extensive investigations on a number of smaller sites during the year, including a study of the Chamouchouane River, where the potential exceeds 600,000 kw, and a study of the Moisie River whose potential could be as high as 1,800,000 kw if a small part of the Kaniapiskau River were diverted into it. Experimental work continued on the planned pumped-generating facility at St. Joachim on the St. Lawrence River near Quebec City. This station will eventually have a usable output of 3,700,000 kw in peak demand periods.

The principal achievement in transmission work in 1971 was the completion of the first of three 735-kv power lines linking the Churchill Falls complex with the Manicouagan and Micoua stations. Hydro-Quebec's 735-kv power line connects with the Churchill Falls transmission system at the Labrador border about 152 miles north of Sept-Îles. Approximately 700 miles of distribution lines were also installed to bring the total network to more than 43,000 circuit miles. Voltages on these lines range from 4 kv to 25 kv.

Ontario. Most of the electric power produced in the province comes from generators of The Hydro-Electric Power Commission of Ontario, Canada's largest power producing and distributing organization. The province's largest hydro-electric generating station is located on the Niagara River at Queenston, where the Sir Adam Beck - Niagara generating stations Nos. 1 and 2 and the associated pumping-generating station have a combined generating capacity of 1,814,950 kw.

Ontario has more thermal capacity than any other province in Canada; capacity installed at the beginning of 1972 was 7,984,000 kw, about 50% of the national total. Ontario Hydro's Lakeview station at Toronto is Canada's largest thermal generating station with an installed capacity of 2,430,000 kw. The Lambton station near Sarnia reached its designed capacity of 2,000,000 kw in 1970. Except for the oil-fired Lennox station now under construction, Ontario's fossil-fuelled thermal plants are designed to be coal-fired.

The Hydro-Electric Power Commission of Ontario is a corporate entity, a self-sustaining public enterprise given broad powers with respect to the supply of electricity throughout the province. Its authority was established by provincial legislation adopted in 1906 to give effect to recommendations that the water power of Ontario should be conserved and developed for the benefit of the people of the province. It now operates under The Power Commission Act (RSO 1970, c.354, as amended). The Commission may have from three to six members, all

appointed by the Lieutenant-Governor in Council. Two commissioners may be members of the Executive Council of the province.

The basic principle governing the financial operations of the Commission and its associated municipal utilities is that electrical service is provided at cost. The Commission interprets cost as including payments for power purchased, charges for operating and maintaining the power-supply facilities, and related fixed charges. The fixed charges represent interest on debt, provision for depreciation, allocations to reserves for contingencies and rate stabilization and provision for retirement of the Commission's capital debt on a sinking-fund basis. While the enterprise has been self-sustaining from the beginning, the province guarantees payment of principal and interest on all bonds issued by the Commission. In addition, the province has materially assisted the development of agriculture by contributing toward the capital cost of extending rural distribution facilities under the Hydro-Electric Distribution Act.

The East and West Systems, formerly separate operating entities, were fully integrated in 1970 and, although the capacity of the interconnection is a limiting factor in the exchange of power, the combined facilities now form a unified provincial network. For general day-to-day operations the province is still divided into seven regions, with regional offices located in major municipalities.

The primary concern of the Commission is the provision of electric power by generation or purchase to more than 350 electrical utilities for resale in municipalities having cost contracts with the Commission. The Commission also supplies power in bulk, although not under cost contract, to direct customers, mostly industrial customers whose requirements are so large or so unusual as to make service by local municipal utilities impracticable. These include mines, industries in unorganized territories, and certain interconnected systems.

In addition to these operations which represent about 90% of its energy sales the Commission delivers electric power to retail customers in rural areas and in a small group of 15 municipalities served by Commission-owned local distribution facilities. However, retail service is generally provided by municipal electrical utilities, owned and operated by local commissions, which supply ultimate customers in most cities and towns, in many villages, and in certain populous township areas. In addition to administering the enterprise over which it has direct control, the Commission, under The Power Commission Act and The Public Utilities Act, exercises certain regulatory functions, particularly with respect to the group of municipal electrical utilities it serves.

During 1971, the Commission's investment in fixed assets at cost increased by \$474 million and mounted to \$5,062 million at the end of the year. Total assets, after deducting accumulated depreciation, were \$5,064 million. In that year, 353 municipal electrical utilities, with net assets amounting to \$1,361 million of which \$553 million was equity acquired in the Commission's assets, purchased power under cost contracts from the Commission for retail distribution. Combined assets of the Commission and the municipal electrical utilities, after deduction of the municipal equity, increased by \$500 million to a total of \$5,872 million.

To meet power demands of the system at primary peak time, resources of the Commission in December 1971 included generating capacity of 6,257,600 kw at hydro-electric stations and 7,308,500 kw at thermal-electric stations. Power available under purchase contracts decreased by 10,900 kw to 375,000 kw. Service was provided directly or indirectly to 2,434,466 ultimate customers, and met a maximum primary demand of 11,534,528 kw. The maximum total of primary and secondary demand in December 1971 was 12,271,127 kw, 661,853 kw higher than that in 1970.

In addition to the province-wide Ontario Hydro system, a few investor-owned utilities provide service to customers in Cornwall, Fort Erie, Gananoque, and Sault Ste. Marie.

The net addition of approximately 1,300,000 kw (292,000 kw hydro and 990,500 kw thermal) to the Ontario Hydro system during 1971 gave the province a total generating capacity of 14,994,000 kw, the highest in Canada.

The only significant hydro-electric addition during 1971 was the commissioning of the 228,000-kw Lower Notch station on the Montreal River. The flooding of the forebay for this station necessitated salvage and demolition operations on two older hydro-electric generating stations located upstream; the 2,000-kw Fountain Falls plant and the 9,600-kw Upper Notch plant were removed from service during the early part of the year. Ontario Hydro announced plans during the latter part of 1971 to construct an 87,000-kw hydro-electric plant in two units

on the Madawaska River near Arnprior but construction was delayed pending solution of a number of problems. The station had been scheduled for completion in 1976.

Almost all sizable water-power sites in Ontario within easy reach of demand centres have now been developed but planners are studying more remote sources as improvements in long-distance transmission techniques may soon bring some of these sites within economic range. Meanwhile, expansion in the short term will all be thermal, whether conventional or nuclear.

The highlight of 1971 for Ontario Hydro came in April when the first of four 540,000-kw nuclear units was placed in service at the Pickering station east of Toronto. A second 540,000-kw unit went on line in October. Units 3 and 4 were scheduled to see service in 1972 and 1973, respectively. During 1972, three additional 7,500-kw gas turbine auxiliary units were expected to complement three similar units already installed at Pickering.

Employing the CANDU (Canadian Deuterium Uranium) system, which uses natural uranium fuel and a heavy-water moderator, the Pickering operation is being closely watched by energy producers the world over. It is the third and largest nuclear station to see service in Ontario; the 20,000-kw Nuclear Power Demonstration (NPD) plant at Rolphton was commissioned in 1962 followed by the 220,000-kw Douglas Point station in 1966. Ontario Hydro has co-operated closely with Atomic Energy of Canada Limited, the designer, in the building and operation of all three facilities.

Construction is proceeding on a fourth nuclear development, the 3,200,000-kw Bruce complex near Kincardine, and first power should be available by 1975; completion of the four-unit plant is scheduled for 1978. In conjunction with the generating station, a plant to produce the heavy water needed for the moderator is also being built.

In addition to the nuclear stations, construction is also under way on two large conventional steam generating plants. The first of two 500,000-kw coal-fired units at the Nanticoke station (near Port Dover) began to deliver power during 1972; another six units of similar size are scheduled to go on line between 1973 and 1977 (two of them in 1974), bringing the total capacity to 4,000,000 kw. The 2,295,000-kw oil-fired Lennox station being built west of Kingston is expected to have its first two units operative by 1975 with the final two coming on line in 1976 and 1977.

A sizable expansion of Ontario's transmission network was also accomplished during the year with about 900 circuit miles of transmission line and nearly 3,000,000 kilovolt-amperes of transformer capacity being installed.

Manitoba. Manitoba Hydro is the primary agency responsible for the generation and distribution of electric power in the province. The corporation was formed April 1, 1961, merging The Manitoba Power Commission, the provincial distributing agency created in 1919 to serve rural Manitoba, and The Manitoba Hydro-Electric Board, the power generating and development authority established in 1951.

Manitoba Hydro serves 254,263 consumers in some 700 communities throughout rural Manitoba and suburban Winnipeg. Electrical energy transmitted over 39,300 miles of Manitoba Hydro line totalled 9,900 million kwh. Manitoba Hydro operates nine hydro-electric stations, two thermal-electric stations and 26 isolated diesel plants with installed capacity totalling 2,235,258 kw. The nine hydro stations and two thermal stations, operated in conjunction with the City of Winnipeg Hydro Electric System's Pointe du Bois and Slave Falls stations, form the Manitoba Integrated System.

Pine Falls, McArthur, Seven Sisters and Great Falls hydro stations are on the Winnipeg River approximately 70 miles northeast of Winnipeg; Grand Rapids hydro station is on the Saskatchewan River 285 miles northwest of Winnipeg; and Kelsey and Kettle Rapids hydro stations are 400 and 450 miles northeast of Winnipeg on the Nelson River. Responsibility for operation of the Sherritt Gordon Mines Laurie River hydro stations 1 and 2 was assumed by Manitoba Hydro in May 1970. A power line 140 miles northwest from Thompson to Laurie River ensures that continuing growth in power requirements at Sherritt Gordon's mining properties and the town sites of Lynn Lake, Fox Lake and Leaf Rapids will be met.

Of the three Prairie Provinces, Manitoba, with immense hydro-electric capabilities on the Winnipeg, Churchill, Nelson and Saskatchewan rivers, is the most generously endowed with water power resources. Until recently, hydro-electric generating stations on the Winnipeg River supplied most of the power requirements of southern Manitoba. Manitoba Hydro's

high-voltage, long-distance transmission lines, however, will carry ever-increasing amounts of power south from hydro-electric stations on northern rivers to help meet the province's constantly growing power demands. Of particular interest is the initial development of the Nelson River system where Kettle Rapids, the latest site being developed, has five of a projected 12 generating units in service with a nominal rating of 102,000 kw per unit. The output of the Kettle station is being transmitted at ± 450 kilovolts to southern Manitoba via a 525-mile high-voltage direct-current (HVDC) transmission line and converted to alternating current at the Dorsey Converter Station 12 miles west of Winnipeg.

The 1971 expansion program in Manitoba continued to stress development of the province's abundant hydro-electric potential. Three 102,000-kw units were added to the Kettle generating station on the Nelson River bringing the plant's capacity at the end of that year to 408,000 kw. Eight units were to be added between 1972 and 1975 at a rate of two per year. Completion of the seventh and final unit (33,750 kw) at another Nelson River development, the Kelsey station, was also scheduled for 1972. This will bring the total capacity of Kelsey to more than 236,000 kw. The next project to be developed will be a 160,000-kw station at the Jenpeg site on the Upper Nelson River north of Lake Winnipeg. It is expected that these additions will be adequate to meet Manitoba's load requirements until the late 1970s. Thereafter, additional capacity will be obtained primarily from undeveloped power sites on both the Nelson and Burntwood rivers in the northern portion of the province.

Manitoba Hydro plans to apply for a licence to divert water from the Churchill River into the Nelson River via the Burntwood River. Such a diversion would not only increase the energy available from the Nelson but would permit development of a number of sites on the Burntwood River.

Thermal-electric expansion in Manitoba is currently restricted to the addition of numerous small internal combustion units in the northern reaches of the province. In aggregate, more than 4,200 kw of new diesel capacity were installed at various communities.

Substantial additions were made to the province's transmission and sub-transmission systems during the year. Atomic Energy of Canada completed two HVDC transmission lines between Radisson (near Kettle) and Dorsey (near Winnipeg). AECL is currently proceeding with 1,080,000 kw of HVDC conversion equipment. Future transmission plans call for a 230-kv line from La Vérendrye to St. Léon to service a rapidly growing industrial load in the south-central portion of the province. Both of these lines should be operational by 1973.

Saskatchewan. The Saskatchewan Power Corporation was established in 1949 by the Power Corporation Act (RSS 1965, c.40, as amended) as a successor to the Saskatchewan Power Commission which had been in operation since 1929. The original functions of the Corporation included the generation, transmission and distribution, sale and supply of electrical energy with the objective of making electricity available to all the people of the province, in abundance and at reasonable rates. Since 1952, the Corporation has also been authorized to produce or purchase and to transmit, distribute, sell and supply natural or manufactured gas.

In 1972, the Corporation served 126 communities with populations of 500 or more, about 875 smaller communities and 106 summer resorts. In addition, bulk power was supplied to Saskatoon, Swift Current and Battleford. A wholly owned subsidiary, North-Sask Electric Ltd., is responsible for providing and improving electrical service to communities in northern Saskatchewan.

At the end of December 1972 the Corporation provided electric service to approximately 277,500 customers, composed of 203,450 "urban" (an urban community is defined as one in which there are at least six customers) and 74,050 "rural" customers. Energy sales totalled 5,300 million kwh with industrial customers accounting for 45% and residential customers for 17% of the total. During 1972, a total of 5,900,000,000 kwh was supplied to the system, almost all of it generated in Corporation plants. In December, the provincial peak load reached a new high of 1,138,000 kw. The Saskatchewan Power Corporation owned and operated 5,450 miles of transmission lines of 72 kv and over and 72,541 miles of less than 72 kv (excluding urban distribution). At the end of 1972, the Corporation had invested, at cost, \$567.8 million in electrical system assets out of a total corporate plant-in-service investment of \$789.1 million.

Large water-power resources exist in the central and northern parts of Saskatchewan, principally on the Churchill, Fond du Lac, and Saskatchewan rivers. Power from Squaw

Rapids and Coteau Creek on the Saskatchewan River is now being fed into the transmission network serving the more settled areas of the province. Before completion of this development in 1963, these areas had been served by electric power produced almost exclusively in thermal plants fuelled by coal, oil or natural gas; hydro-electric power had been used almost exclusively for mining purposes in northern areas. Thermal generation will provide the next stage of expansion with extensions under way at the Boundary Dam (Estevan) and Queen Elizabeth (Saskatoon) stations. In 1972, hydro accounted for only some 40% of the electrical energy produced.

No new additions were made to Saskatchewan's generating facilities during 1971. A 100,000-kw thermal unit scheduled to be brought into service at the Queen Elizabeth station during the year was delayed but was brought on line in 1972. The only other expansion currently under way is a 150,000-kw coal-fired unit addition to the Boundary Dam station near Estevan. When completed in midsummer 1973, this plant will boast an over-all capacity of 582,000 kw, by far the largest in the province. The forecast additional needs will be met by the purchase of 100,000 kw from Manitoba Hydro under a one-year contract commencing November 1, 1972.

Alberta. Electric power generation in Alberta is provided by two major investor-owned companies and three municipal utilities. In addition, several other municipal systems handle local distribution of power purchased from the investor-owned utilities. Companies previously known as Canadian Utilities, Limited and Northland Utilities Limited merged their resources in 1972 into a single company known as Alberta Power Limited.

The Energy Resources Conservation Board regulates the construction and operation of the electric utilities under the Hydro and Electric Energy Act of the province of Alberta while the Public Utilities Board regulates the rates.

The installed capacity in the province as at December 31, 1972 was 2,771,000 kw, an increase of 10% over the 2,679,000 kw recorded a year earlier; total energy generated increased by 13% from 11,098,000 kwh in 1971 to 11,700,000 kwh in 1972. While 27% of the total generating capability of the province was in hydro sources in 1971, all but 11.6% of the total power generated came from conventional thermal plants with steam units providing 85% of that total.

In Alberta, most of the principal hydro-electric developments are located on the Bow River and its tributaries and, from these developments, Calgary Power Ltd. serves most of the southern part of the province. The Big Bend hydro-electric development on the Brazeau River in the headwaters of the North Saskatchewan River, completed in 1967, augmented the energy from the Bow River plants and the Bighorn development on that same river added 108,000 kw in 1972. Substantial water power resources are located in the northern regions and, although these are somewhat remote from present centres of population, the advent of extra-high-voltage transmission has enhanced the prospect of their development.

The availability of vast fossil-fuel resources accounts for the emphasis on thermal power generation in Alberta; the province's largest thermal plants are the 405,000-kw gas turbine and steam station at Edmonton and the 582,000-kw Wabamun steam station. Although no significant additions were made to the province's generating capacity during 1971, extensive expansion, particularly in relation to thermal generation, was either nearing completion or in the planning stage.

Alberta Power completed its 140,000-kw H.R. Milner coal-fired generating station near Grande Cache during the fall of 1972 and plans to add a fourth 150,000-kw unit to its Battle River plant near Forestburg. With the addition of this new unit in 1975, the Battle River plant will have an over-all capacity in excess of 365,000 kw. A second 165,000-kw unit presently being installed at Edmonton Power's Clover Bar station should be on line by 1973. The addition of a second 286,000-kw unit to Calgary Power's Sundance station (near Wabamun) in 1974 will make it the largest generating plant in Alberta (572,000 kw). Calgary Power has filed application with the Energy Resources Conservation Board of Alberta to install third and fourth units at Sundance. It is hoped that these two additional 375,000-kw units can be placed in service in 1976 and 1977, respectively. Should all these plans be realized, Alberta's thermal generating capability in 1977 will be more than 70% greater than at the end of 1971.

Calgary Power is the only one of Alberta's utilities planning expansion to the province's hydro-electric system. The 108,000-kw Bighorn station on the North Saskatchewan River was

completed by late fall 1972. The Bighorn power storage development is a multipurpose project undertaken jointly by Calgary Power Ltd. and the Alberta government. In addition to making more electric power available, the project will greatly assist the government's water management program by providing a better distribution of Alberta's water resources between the northern and southern sections of the province. It will also make diversion of part of the North Saskatchewan River into the Red Deer River system economically feasible. Extensive development of the area's recreational potential is being planned as well. A study of the potential of the Athabasca and Slave rivers by Calgary Power has revealed a possible 3,000,000-kw in undeveloped hydro-electric capacity. Financial considerations have, however, made these developments economically unattractive at the present time.

Alberta Power undertook a sizable expenditure during 1972 for high-voltage transmission lines in the Drumheller, Grande Prairie and Vegreville areas and existing transmission substations were upgraded to cope with the increased load.

British Columbia. In terms of installed hydro capacity, British Columbia is exceeded only by Ontario and Quebec. The province has many mountain rivers offering abundant opportunity for the development of hydro-electric power; notable for the magnitude of their power potential are such rivers as the Columbia, the Fraser, the Peace and the Stikine. Hydro developments on smaller rivers in the south once met the major load requirements of the province but in 1968 the immense power resources of the Peace River began to supplement the energy supply. Development of the hydro potential of the Canadian portion of the Columbia River is now under way, utilizing water from three huge storage dams, two of which have already been completed; the third, Mica Dam, which became operational in 1972 measures 800 ft from base to crest and is the largest earthfill dam in Canada.

The foremost producer and distributor of electric power in British Columbia is the British Columbia Hydro and Power Authority, a provincial Crown corporation. B C Hydro operates a diversified system of public utilities including transportation services by rail, sea and road. Electric power is generated, transmitted and distributed throughout areas of the province containing more than 90% of the population. Natural gas is purchased and distributed in Greater Vancouver and in the Fraser Valley, and liquefied petroleum gas in Greater Victoria.

Of B C Hydro's electric power requirements totalling 17,977,000,000 kwh for the year ended March 31, 1972, 16,221,000,000 or 90%, were produced by hydro-electric stations and 721,000,000 kwh (4%) by thermal plants; the remaining 1,035,000,000 kwh were purchased primarily from Canadian sources. Kilowatt-hours of electricity sold during 1971-72 (16,174,600,000) were 10.9% higher than during the previous year, with gains recorded for all categories of customers. Residential consumption increased 9.6%, commercial 11.0%, and industrial 12.3%. As at March 31, 1972, 726,000 customers were served with electricity, 36,000 more than during the previous year. Gross revenues from electrical services were \$211,425,389, up 9.6%. The average annual rate for residential customers remained at 1.9 cents per kilowatt-hour, and the average annual residential consumption increased from 6,949 kwh to 7,342 kwh. Installed nameplate generating capacity as at March 31, 1972 totalled 3,852,364 kw (2,813,922 kw hydro and 1,038,442 kw thermal generating capacity). The integrated system peak one-hour demand was 2,970,000 kw, 7.3% higher than the recorded peak in the fiscal year ended March 31, 1971.

Considerable circuit mileage was added to the transmission system in British Columbia during 1971 including a 100-mile 230-kv line connecting the East Kootenay region to the integrated grid system, a 53-mile 230-kv line between Kelly Lake (near Clinton) and a new substation at 100 Mile House, conversion of the 60-kv line to 138 kv in the Thompson River valley, and a 62-mile line between Nicola substation and the Similkameen Mining Company's new operation south of Princeton.

Although expansion in the immediate future will continue to concentrate heavily on the development of additional hydro-electric capacity, long-term plans call for substantial increases in thermal-electric generation as well. A total of 377,000 kw of new hydro-electric capacity was brought into service in 1971 and added to B C Hydro's system. A sixth 227,000-kw unit was installed at the Gordon M. Shrum station on the Peace River while redevelopment of the Jordan River station accounted for the remaining 150,000 kw. With the commissioning of this new unit at Jordan River, the four old units with a combined capacity of 26,400 kw were retired from service. The year 1972 should see the completion of one hydro-electric station, the

50,000-kw Whatshan plant on the Whatshan River, and the installation of units 7 and 8 (227,000 kw each) at the Gordon M. Shrum station. The contract has been awarded for a ninth 227,000-kw unit at the same plant to be on line by the fall of 1974. The Kootenay Canal project on the Kootenay River and the Mica Dam project on the Columbia River will provide another 50,000 kw (1975-77) and 1,740,000 kw (1976-77), respectively. It is anticipated that two additional 435,000-kw units will be installed at Mica Dam at a later date, bringing the plant's ultimate capacity to 2,610,000 kw.

About two thirds of British Columbia's thermal generating capacity is installed in three plants located in the Vancouver area. The capacity of the largest of these plants, the Burrard generating station, will be increased to 900,000 kw in 1974 with the addition of a sixth 150,000-kw unit.

Thermal-electric additions during 1971 were fairly minor with approximately 3,000 kw of new diesel capacity being added at various locations. With a number of stations being removed from service completely and the capacity being reduced substantially in others, there was a net loss of 21,000 kw from the province's total internal combustion capacity over the year. The more noticeable decreases included a 7,000-kw reduction in capacity at the Dawson Creek station (resulting capacity 13,000 kw) and the retirement of the 5,000-kw Chetwynd and 9,000-kw Prince George stations, all owned by B C Hydro.

Two new gas turbine stations are being planned: a single-unit 40,000-kw plant at Port Hardy in 1973 and a two-unit plant of 28,600-kw each at Prince Rupert in 1973-74. Provision has been made for added capacity at the Port Hardy plant in future years.

Yukon and Northwest Territories. The Northern Canada Power Commission, a Crown corporation established in 1948, operates under authority of the Northern Canada Power Commission Act (RSC 1970, c.N-21) which empowers it to survey utility requirements, construct, and operate public utility plants in the Northwest Territories, Yukon Territory and, subject to the approval of the Governor in Council, elsewhere in Canada. The Act requires that projects undertaken by the Commission be self-sustaining; consequently, rates charged for the utilities supplied must provide sufficient revenue to cover interest on investment, repayment of principal over a period of years, operating and maintenance expenses, and a contingency reserve.

A preliminary evaluation of hydro-electric potential has been made for most of the major rivers in the Yukon Territory and in the central portion of the Mackenzie District of the Northwest Territories. Results indicate that a very substantial water-power potential exists; the Yukon River and its tributaries alone represent some of the largest undeveloped hydro-electric resources in North America.

Until 1965, most of the power needs of the Northwest Territories were met from thermal sources but in that year commissioning of the Twin Gorges hydro station on the Taltson River altered the balance in favour of hydro. However, with several new additions over the 1970-71 period, thermal facilities once again became the dominant source of power. During 1971, thermal generation also became the larger contributor in the Yukon Territory. Most of the thermal-electric energy in the territories has been generated by small diesel units. Future growth will probably continue to concentrate on diesel generation but the units installed will be substantially greater in size.

The Northern Canada Power Commission has hydro-electric power developments on the Yukon River near Whitehorse and on the Mayo River near Mayo in the Yukon Territory; in the Northwest Territories, it has developments on the Snare River northwest of Yellowknife and on the Taltson River northeast of Fort Smith.

The 5,100-kw Mayo River hydro-electric development has supplied power to mining properties in the Elsa and Keno areas and to the communities of Mayo and Keno City since 1952. The Whitehorse Rapids power development (hydro capacity 19,000 kw), in service since 1958, supplies power to the Yukon Electrical Company for distribution in the city of Whitehorse and to a copper-mining operation located within a few miles of Whitehorse. The Company, an Alberta Power subsidiary, planned minor expansion of its generating and transmission facilities in 1972. A 225-mile transmission line completed in 1969 supplies Anvil Mining Corporation Limited's lead and zinc mine-mill complex at Faro in the Vangorda Creek area. A 9,000-kw peaking standby diesel-electric generating plant, adjacent to the hydro-electric plant at Whitehorse, was commissioned in December 1968, and an additional

5,000-kw diesel-electric plant was installed in 1970. In the same year a similar plant was installed at Faro, near the Vangorda Creek end of the 225-mile transmission line.

The two Snare River hydro-electric power developments, with a total generating capacity of 14,000 kw, commissioned in 1948 and 1960, respectively, supply power to the gold mines in the Yellowknife area, the city of Yellowknife, and the communities of Rae/Edzo. These two plants are operated by remote control from Yellowknife and have been supplemented by a 5,150-kw diesel-electric plant in Yellowknife, completed in 1970. The Taltson River hydro-electric plant is an 18,000-kw development supplying the lead-zinc mining and milling operation at Pine Point and the communities of Fort Smith, Pine Point and Fort Resolution, NWT. This plant is operated by remote control from Fort Smith. A 5,150-kw diesel-electric plant was completed in 1970 at Pine Point.

Diesel-electric power plants are operated by the Commission at Aklavik, Coppermine, Tuktoyaktuk, Fort Norman, Fort Franklin, Cambridge Bay, Fort Good Hope, Norman Wells, Chesterfield Inlet, Baker Lake, Rankin Inlet, Gjoa Haven, Whale Cove, Spence Bay, Eskimo Point, Holman, Pelly Bay, Cape Dorset, Arctic Red River, Sach's Harbour, Coral Harbour, Repulse Bay, Lake Harbour, Pangnirtung, Broughton Island, Igloolik, Hall Beach, in the Northwest Territories, at Dawson in the Yukon Territory, and at Field in British Columbia. The Commission also operates and maintains utility plants comprising electric power, central heat and water and sewerage services at Inuvik, Frobisher Bay and Fort McPherson in the Northwest Territories and Moose Factory in Ontario; it operates the water and sewerage systems at Dawson in the Yukon Territory, and provides electric power and central heating services at Fort Simpson, NWT. A 5,150-kw diesel unit was added to the Inuvik station in 1971, raising the capacity of that station to more than 10,000 kw. The only other addition of consequence during the year was a 500-kw unit placed into service at Northland Utilities' Hay River plant.

Northland Utilities, an Alberta Power associate company, added two 1,200-kw generators to the Hay River plant in 1972 to replace the present mobile generators. Northern Canada Power's 69-kv transmission line connecting Tuktoyaktuk and Inuvik was completed in 1972.

13.3.10 Electric power statistics

Electric power statistics presented in this Section are based on reports of all electrical utilities and all industrial establishments that generate energy, regardless of whether or not any is sold, and therefore show the total production and distribution of electrical energy in Canada. Utilities are defined as companies, commissions, municipalities or individuals whose primary function is to sell most of the electrical energy that they have either generated or purchased. Industrial establishments are defined as companies or individuals that generate electricity mainly for use in their own plants.

The current series of electric power statistics dates back to 1956. Earlier reports, entitled *Central electric stations*, were concerned solely with the electrical utility industry and hence excluded statistics relating to power produced by industrial establishments for their own use, although power sold by such establishments was included. Figures appear in Tables 13.15-13.20.

Of the total power generation of 216,472,203,000 kwh in 1971, 74.4% was produced from hydraulic sources and 25.6% from thermal units. The proportions differed markedly from province to province, ranging from a high of 98.8% hydro and 1.2% thermal in Quebec to 100% thermal generation in Prince Edward Island, Newfoundland, with 93.9% hydro and 6.1% thermal, narrowly edged Manitoba with 93.7% and 6.3% and British Columbia with 91.8% and 8.2%, respectively. The Territories produced 75.5% of their power needs from hydro sources and 24.5% from thermal units. Ontario with 55.5% hydro and 44.5% thermal and Saskatchewan with 42.3% hydro and 57.7% thermal were closest of all the provinces to a balance between the two forms of energy source. In decreasing proportion of use of hydraulic sources came New Brunswick with 36.5% against 63.5% thermal; Nova Scotia, 19.0% and 81.0%; and Alberta with 10.8% and 89.2%. More detailed information will be found in Table 13.15.

Table 13.16 gives summary figures of power production and distribution classified by province, and Tables 13.17 and 13.18 give figures classified by type of production establishment. Total installed capacity in Canada amounted to 46,675,733 kw in 1971, an increase of 3,850,088 kw over 1970. Of the 1971 total, 41,369,224 kw were accounted for by utilities and the remainder by industrial establishments. During 1970 and 1971, total sales to

ultimate customers amounted to 137,972,093,000 kwh and 147,202,729,000 kwh, respectively, of which 99.8% in both years was sold by utilities.

Sales to power customers, excluding sales to industrial establishments with generating facilities, made up 48.7% of the total in 1970 and 46.8% in 1971, sales to domestic and farm customers were 31.5% and 31.6%, respectively, and commercial sales 18.8% and 20.6%, respectively. Exports to the United States in 1971 amounted to 7,320,922,000 kwh, an increase of 1,689,532,000 kwh over 1970.

Average domestic and farm consumption rose from 7,147 kwh in 1970 to 7,488 kwh in 1971. Among the provinces, the averages in 1971 varied from a low of 4,296 kwh in Prince Edward Island to a high of 9,210 kwh in Manitoba. For domestic and farm customers across Canada the average annual bill was \$120.48 in 1971 as against \$112.77 in 1970. Although many utilities do not keep records on farm customers separate from other domestic customers, the data reported on farm service in Manitoba, Saskatchewan and Alberta only indicate that the average consumption rose from 9,906 kwh per customer in 1970 to 11,006 kwh in 1971 and the average bill from \$175.70 to \$189.40. Table 13.19 provides more detailed information including the total number of customers served.

In 1971, natural gas accounted for 10.8% of thermal generation by utilities, coal for 69.5%, petroleum fuels for 11.8% and nuclear fuel for 7.9%; corresponding proportions in 1970 were 12.7%, 72.3%, 12.7%, and 2.3%, respectively. Details of the type of fuel used, by province, appear in Table 13.20.

¹ Equivalent fuel displacement.

² The value for the hydro input into electricity is obtained by using the same ratio as that for the 1971 thermal input into electricity. This was not the method used in constructing the "Approximate energy-use balance in Canada, 1965", presented in the 1969 Year Book, p. 638. Had the present method been used, the 19% figure for the proportion of energy used in the generation of electricity would have been approximately 35%. The coal equivalent of the hydro input would have been about 48.8 MM metric tons instead of the 14.6 MM metric tons shown.

³ 1 barrel = 35 Canadian gallons.

⁴ Short tons = 2,000 lb.

Chapter 14

Housing and construction

14.1 Housing

14.1.1 Government aid to housing

14.1.1.1 Federal assistance

The role of the federal government in housing has expanded progressively since the introduction of the first continuing statute in 1935. Although the government originally entered the housing field in 1918 when it made money available to the provinces for re-lending to municipalities for housing purposes, the first general piece of federal housing legislation was the Dominion Housing Act passed in 1935. This was followed by the National Housing Acts of 1938 and 1944, culminating in 1954 with the present National Housing Act, defined as “an Act to promote the construction of new houses, the repair and modernization of existing houses and the improvement of housing and living conditions”. Central Mortgage and Housing Corporation (CMHC), a Crown agency incorporated by Act of Parliament in 1945, administers the National Housing Act and co-ordinates the activities of the federal government in housing. The Corporation has the authority and responsibility for a variety of functions affecting housing in its long-term outlook as well as in its immediate requirements. It is empowered to act as an insurer of mortgage loans, as a lender or investor of public funds, as a guarantor and as an owner of property and other assets. It also acts as a research agency in fields associated with housing and assists provinces and municipalities in many aspects of urban growth. In general, the government, through successive Housing Acts, has attempted to stimulate and supplement the market for housing rather than assume direct responsibilities that rightfully belong to other levels of government or that could be borne more effectively by private enterprise. In each case the aim has been to increase the flow of mortgage money and to encourage lenders to make loans on more favourable terms to prospective home-owners. Close to half of the country’s present stock of approximately 6 million dwelling units have been built since the first covering legislation was enacted; about one third of these were financed in one way or another under the Housing Acts.

Under the terms of the National Housing Act, 1954 and its subsequent amendments, as now set out in RSC 1970, c.N-10, the federal government makes available the following assistance.

Insured loans. Insured mortgage loans may be made for both home-ownership and for rental housing. They are normally available from approved lenders to individual home-owner applicants, to builders constructing houses for sale or for rent and for some special groups, such as co-operative housing associations and farmers. Insured loans are also available for the purchase, improvement, refinancing or sale of existing dwellings. The conditions governing the making of NHA loans are contained in National Housing Loan Regulations.

Upon application, the borrower pays CMHC a fee of \$35 per unit to help defray expenses incurred in the examination of plans and specifications, in the determination of lending values and in compliance inspections during construction. An approved lender requires evidence that a home-owner or home-purchaser is providing 5% of the value of the house from his own resources. For the home-owner this equity may be in the form of cash or a combination of cash, land and labour; for the home-purchaser it may be in cash or labour. The regulations require that gross debt service — the ratio of repayments of principal and interest plus municipal taxes to the income of the borrower — should not exceed 27%, although instances involving higher ratios may be considered on their merits. The borrower pays an insurance fee which is added to the amount of the loan and is repaid over the term of the mortgage; the fee ranges from ⅞% to 1¼% of the loan, according to type of unit and timing of mortgage advances. The NHA interest rate is free to find its own level in relation to the open market.

The loan ratio for new housing, including that for condominium tenure, may be for up to 95% of value. For open market rental accommodation the ratio may be up to 90%. Loan maximums vary with the type of rental housing but cannot exceed those for similar dwellings built for ownership. Current (1972) maximums are: single family units, \$30,000; apartment multiple units, \$23,000; and hostels, \$10,000 per person accommodated. Loans for the

purchase of existing housing may be up to 95% of value. Maximums for single, semi-detached and row housing are \$23,000 per unit. These loans are not available for rental housing or for the purchase of buildings containing three or more housing units. The period of repayment may be up to 40 years for new home-ownership and rental housing. For existing housing this period is 40 years or the remaining life of the building, whichever is the lesser.

Direct loans. CMHC may make direct loans for both home-ownership and rental housing where, in the opinion of the Corporation, loans are not available through approved lenders. Loans are made to any eligible home-owner applicant but direct loans to builders are normally subject to a requirement that the houses be pre-sold to satisfactory purchasers. In 1971, private funds made available for mortgage loans were about double the level for 1970. The resulting decreased demand for CMHC direct loans produced a drop of 47% in federal aid to new construction in the private market and an increase in federal funds for the financing of lower-cost housing.

CMHC may make loans to any organization, corporation or individual to assist in financing the construction of low-rental housing projects or in the purchase of existing buildings and their conversion into low-rental housing projects. In addition to self-contained units, developments may include hostel or dormitory accommodation for elderly and low-income individuals. Loans may be up to a maximum of 95% of the lending value established by CMHC. The period for repayment may not exceed the useful life of the project and in any case may not be for more than 50 years; the interest rate is established by Order in Council. Plans and specifications for such projects as well as financing and operating arrangements must be approved by the Corporation.

Since December 1960, the National Housing Act has made funds available to assist in the elimination or prevention of water and soil pollution. CMHC is authorized to make a loan to a province, municipality or a municipal sewerage corporation to construct or expand sewage treatment facilities. The loan may not exceed two thirds of the cost of the project and the maximum repayment term is 50 years from date of completion. Interest is at a rate fixed by the Governor in Council. Agreements covering such projects contain a "forgiveness" clause applicable to both the principal of the loan and accrued interest conditional on satisfactory completion by March 31, 1975. If construction is not complete by that date, 25% of the loan advanced or warrantable by construction progress, plus 25% of the accrued interest on advances, may be forgiven.

Long-term loans are available to a province or its agency, a municipality or its agency, a hospital, school board, university or college, co-operative association or charitable corporation for construction of student housing projects, or to acquire existing buildings and convert them into student residences. In all cases, the government of the province concerned must approve the loan. CMHC may lend up to 90% of the project cost, subject to maximum amounts as follows: \$30,000 per new unit; \$23,000 per self-contained unit or existing housing unit; and \$8,000 per student housed in dormitory or hostel accommodation. The term of the loan may not exceed 50 years or the existing life of the building, whichever is less. The interest rate is prescribed by the Governor in Council.

Home improvement loans. CMHC is authorized to give a limited guarantee to banks or approved instalment credit agencies in return for an insurance fee paid by the borrower on loans made for additions, repairs and alterations to existing houses and apartments. A home improvement loan and the balance owing on any existing NHA home improvement loan on the property may not exceed \$4,000 for a one-family dwelling or \$4,000 for the first unit of a duplex, semi-detached or multiple-family dwelling, plus \$1,500 for each additional unit. Loans are repayable in monthly instalments over a period not exceeding ten years. The maximum rate of interest is restricted to $2\frac{1}{4}\%$ above the long-term government bond rate adjusted quarterly to the nearest one eighth of 1%.

Public housing. Under the National Housing Act and complementary provincial legislation, the federal and provincial governments may enter into partnership agreements to build rental housing for families and individuals of low income or to purchase and rehabilitate existing housing for this purpose; hostel or dormitory accommodation, in addition to self-contained units, may be included. The federal government pays up to 75% of the capital costs and the provincial government the remainder, although the latter may call upon the municipality concerned to bear a portion of the provincial share. Rents for units in federal-provincial

projects are related to the tenant's family income and size of family. Operating deficits are shared on the same contractual basis as the capital costs.

As an alternative, CMHC may make long-term loans to a province, or to a municipality or public housing agency with the approval of the province, to provide public housing accommodation. Projects may consist of new construction or existing buildings and include dormitory and hostel accommodation as well as self-contained family units. Loans may be up to 90% of the total cost as determined by CMHC and for a term as long as 50 years but not in excess of the useful life of the development. The maximum that may be borrowed for a fully serviced apartment is \$20,000, and for hostels \$10,000 for each person accommodated. For a house, the maximum is \$30,000. The interest rate is set by the Governor in Council. Where this alternative is selected, federal grants may be made covering up to 50% of losses incurred in the operation of public housing projects, for a period of up to 50 years but not exceeding the useful life of the project. Annual subsidies are shared by CMHC and the province concerned.

Urban renewal. Federal grants and loans are available under the Act for provinces and municipalities undertaking programs of urban renewal. CMHC, with federal government approval, may arrange with a municipality to undertake a study to identify blighted areas, determine housing requirements and provide data upon which an orderly program of conservation, rehabilitation and re-development can be based. The federal contribution may be as much as 75% of the cost. The legislation also authorizes federal contributions equal to one half of the costs of preparing an urban renewal scheme setting out proposals for urban renewal action, a similar cost-sharing arrangement for the implementation of a scheme, and loans up to two thirds of the provincial or municipal share of the cost of carrying out an urban renewal scheme. Loans may be for 15 years at an interest rate prescribed by the Governor in Council. To encourage the improvement and conservation of housing meeting minimum standards of construction, loans are available for the sale, purchase or refinancing of existing housing in urban renewal areas not designated for demolition. Since August 1969 activity under the urban renewal provisions of the National Housing Act has been restricted to prior commitments only.

Land assembly. The federal and provincial governments may enter into an agreement to provide for a land assembly project which involves the development of raw land for housing purposes. The federal government pays up to 75% of the cost and the provincial government the remainder. The latter may call upon the municipality concerned to bear a portion of the provincial share. In addition, loans equal to 90% of the cost of assembling and servicing land for public housing purposes are available at a preferential interest rate to provinces, municipalities and their agencies.

CMHC building. The Corporation may construct and administer housing and certain other buildings on its own account and for other government departments and agencies. Its responsibilities include the provision of architectural and engineering designs, the calling of public tenders and the administration of construction contracts – including any necessary on-site surveying and engineering. On such contracts, the Corporation carries out full architectural and engineering inspections.

Research. CMHC is concerned with building technology in the formulation of standards for housing construction, in the use of suitable materials and in the development of new building techniques. The Corporation has no laboratory facilities but has direct experience of performance in the field and seeks the advice of specialists in various agencies and departments of the federal government in such matters. Research into the factors affecting housing is concerned with the measurement of the demand for new housing, the volume of new housing built and the supply of mortgage money for house construction. The Corporation also co-ordinates and publishes statistical information on housing. Funds provided under the National Housing Act support the activities of the Canadian Housing Design Council, the Community Planning Association of Canada and the Canadian Council on Urban and Regional Research.

Other federal legislation. The Farm Credit Act, providing for federal long-term loan assistance for housing as well as for other farm purposes, and the Farm Improvement Loans Act, providing for guarantees for intermediate- and short-term loans made by approved lending agencies to farmers for housing and other purposes, are described in greater detail in Chapter 11. The Veterans' Land Act, which provides a form of loan and grant assistance to

veterans for housing and other purposes, is dealt with in Chapter 6. These three statutes are concerned only incidentally with housing.

14.1.1.2 Provincial assistance

All provinces have complementary legislation providing for joint federal-provincial housing and land assembly projects and, in addition, most provinces have enacted separate legislation with respect to housing. Details are available from the respective provincial government departments.

14.1.2 Housing activity 1970-71

Studies of urban, suburban and rural growth rates conducted during the late 1960s indicated that, in order to meet Canada's minimum housing need to the end of 1974, a total of 200,000 new units per year for the five-year period 1970-74 would be required. By the end of 1972 approximately 675,000 housing starts had been made in all areas of the country, roughly two thirds of the goal.

Although dwelling starts in 1970, at 190,528, were 9.5% below the record of 210,415 of the previous year, in 1971 the trend reversed, with mortgage loans by conventional and NHA-approved lenders increasing by 38% and 77%, respectively, and dwelling starts increasing 22.6% to a total of 233,653 (Tables 14.1 and 14.2). In 1972, the rising trend continued with dwelling starts rising to 249,914. Conventional loan totals for 1970 and 1971 were \$1,182.8 million and \$1,963 million representing 99,826 and 146,977 dwellings, respectively.

Approved lenders' investment in 1970 for new and existing housing amounted to \$894.6 million, representing 56,280 dwellings and hostel accommodation for 2,830 persons. In 1971, this activity doubled to an investment of \$1,807.2 million for 111,914 units and 3,882 hostel beds.

Direct federal support during 1970 involved 68,178 new and 7,910 existing units for a total of 76,088. Hostel accommodation was provided for 13,093 persons. All hostel accommodation and 47,000 of the dwelling units were for low-income families or individuals. The total federal investment in housing for the year was \$965.5 million. Comparable figures for 1971 involved 53,013 new and existing units and 9,034 hostel beds with loan and capital commitments of \$748.3 million. About 83% of direct lending in 1971 was allocated for low-income housing compared to 72% in 1970.

The average cost of both single-family dwellings and apartment units dropped slightly in 1970 from 1969 as a result of a decrease in construction cost factors. The land-cost element, however, has continued its rise over both years with the result that 1971 total housing costs, including land, averaged \$20,528 for single-family dwellings and \$14,237 for apartment units compared to \$19,915 and \$13,810 in 1970.

Operations under the National Housing Act. NHA mortgage loans amounting to \$2,266.2 million were approved in 1971 for the provision of 145,042 new dwellings and 11,700 hostel beds, compared with loans of \$1,720.1 million approved for 116,294 new units and 12,610 hostel beds in 1970. In 1971, direct lending by CMHC accounted for \$676.2 million representing 47,395 units and 7,818 hostel beds; approved lenders financed 97,647 units and 3,882 beds through mortgage loans aggregating \$1,589.9 million. Comparable figures for 1970 were: CMHC, \$903.4 million for 65,358 units and 9,780 hostel beds; approved lenders, \$816.6 million for 50,936 units and 2,830 beds.

Chartered banks, with a gross investment of \$694 million were the most active of the approved lenders, followed by trust companies at \$413.5 million. Life insurance companies had an investment of \$184.5 million with loan and other agencies totalling \$323.9 million.

Conventional financing of new and existing residential construction in 1971 grossed \$1,963 million for 146,977 units, compared to \$1,182.8 million for 99,826 units in 1970.

Borrower and house characteristics. The average family income of purchasers of NHA-financed houses in 1971 was \$12,005. These incomes were 1.5% higher than the corresponding averages for purchasers in 1970, appearing to be in line with the general increase in incomes in 1971. As in previous years, relatively few purchasers of NHA houses (10.7% in 1971 and 5.3% in 1970) were drawn from the lower third of the range of family incomes.

The average age of purchasers of NHA houses was 32.7 years in 1971 compared to 33.2 in 1970. In 1971, just over one half of the purchasers had two or more children and 24.7% had previously been home-owners.

Percentage increases in total population and dwellings by type and tenure, 1951-1971

The average price of NHA-financed single-family dwellings purchased in 1971, including many started in the previous year, was \$22,181. On these houses, purchasers provided down payments averaging \$3,917. Compared with 1970, these payments represented an increase of 1.3% in price and a decrease of 6.8% in down payment.

As in other years, most of the NHA-financed single detached houses purchased in 1971 were bungalows, representing 69.7% of the total compared with 74.7% in 1970. The proportion of split-level dwellings increased from 18.9% to 24.0%. Two-storey dwellings remained steady at 5.7%. Of these dwellings, about 86.9% had one to three bedrooms and the remainder had four or more.

Aid to low-income groups. In 1971, loans amounting to a total of \$645.8 million were approved to assist in the construction of 45,508 self-contained units of low-rental housing and hostel accommodation for 8,880 persons.

Home-improvement loans. The value of NHA-guaranteed bank loans for home-improvement purposes in 1971 was \$19 million, bringing the total insurance or guarantee in force to \$22.8 million by the end of the year. In 1970, loans totalling \$16.9 million were approved and the guarantee level on December 31, 1970, stood at \$22.3 million. At the end of 1971, the Home Improvement Loan Insurance Fund reserve was \$3.7 million, only slightly higher than in the previous year. The chartered banks reported the outstanding debt on all home-improvement loans as \$51 million in 1970 and \$45.6 million in 1971.

Loans for student housing projects. Loans totalling \$23.4 million were approved in 1971 for 14 student housing projects, involving the construction of 732 self-contained units to provide 2,483 new hostel beds, and acquisition and conversion of existing buildings to provide a further 70 beds (Table 14.3). Comparable figures for 1970 are \$35.7 million for 20 projects to provide 588 new units, 4,553 hostel beds and purchase and conversion of existing buildings to provide an additional ten beds.

From December 1960, when student housing loans were first authorized, to December 1971, 278 loans totalling \$420.6 million were approved involving the construction of 6,105

units and 64,022 beds, and the acquisition and conversion of existing buildings to provide 256 units and 2,785 beds.

Loans for municipal sewage-treatment projects. During 1971, 199 loans amounting to \$66.7 million were authorized to assist municipalities to undertake sewage-treatment projects: one in Newfoundland, amounting to \$97,000; three in Prince Edward Island, \$1.9 million; 21 in Nova Scotia, \$3.3 million; nine in New Brunswick, \$1.7 million; 21 in Quebec, \$4.7 million; 75 in Ontario, \$24.7 million; nine in Manitoba, \$2.9 million; five in Saskatchewan, \$263,000; 22 in Alberta, \$3.8 million; and 33 in British Columbia, \$23.3 million. From December 1960, when assistance for sewage-treatment projects was authorized, to December 1971, 1,925 loans totalling \$463 million were approved.

Mortgage marketing. Sales of NHA-insured mortgages by approved lenders amounted to \$62.7 million in 1971. In the same year, CMHC sold two blocks of agency loans totalling \$21.4 million to the approved lenders who had originated these loans on the Corporation's behalf in 1957-58. Total CMHC sales to the end of 1971 amounted to \$330 million.

Urban renewal. Urban renewal limitations, begun in 1969, continued during 1971. No new studies or scheme preparations were initiated. Implementation of 16 projects supported by federal grants of \$38.3 million and loans totalling \$15 million, was approved during the year. Of the 16 projects approved, 11 were in Quebec, one each in Newfoundland and Ontario, and three in British Columbia.

Subsidized public housing. During 1971, a total of 55 federal-provincial partnership agreements were approved to provide 2,120 new and existing dwellings. The total federal share of the cost was 75%, amounting to \$28.1 million. Comparable figures for 1970 were 31 agreements, 2,176 units, 154 hostel beds and contributions of \$25.3 million. Loan assistance for public housing totalled \$271.6 million in 1971 as against \$220.3 million in 1970. These amounts produced 19,360 units and hostel accommodation for 700 persons in 1971 compared to 17,803 units in 1970. Public housing subsidies borne by the federal government approximated \$17.2 million in 1970 and \$29.8 million in 1971.

Co-operative house-building. Under arrangements with Nova Scotia, New Brunswick and Prince Edward Island, assistance may be given for the co-operative building of houses. In 1970 and 1971 the total number of units approved for construction was 592 and 693, respectively, distributed as follows: Nova Scotia, 512 and 622; New Brunswick, 13 and 6; and Prince Edward Island, 67 and 65. The total in federal funds involved was \$5.3 million in 1970 and \$6.4 million in 1971.

Housing in northern areas. Special agreements exist between the federal government and the governments of Manitoba, Saskatchewan and Alberta for housing people in remote northern areas. In 1971, a total of 50 units was provided in Manitoba with loan support of \$349,000, and 23 in Saskatchewan with loans totalling \$99,000. Comparable figures for 1970 are: Manitoba, 50 units and \$431,000; and Saskatchewan, 34 units and \$188,000. To the end of 1971, Alberta had not used these provisions. Purchasers of these houses are predominantly Indians or Métis.

Land assembly. Under federal-provincial cost-sharing agreements, 11 land assembly projects were approved in 1971 involving development of 1,696 residential lots and federal contributions of \$12.8 million. In 1970 four projects were undertaken for 425 lots and \$5.1 million. A total of 27 loans aggregating \$5.9 million were approved in 1971 for the development of 122 acres compared to \$15.1 million for 2,202 acres in 1970.

14.2 Dwellings and household facilities

Over the past 30 years, decennial censuses of Canada have included a comprehensive inventory of the nation's dwelling stock in the form of a complete housing census taken in conjunction with the censuses of population and agriculture. Detailed information on this subject covering the 1941-71 period may be found in the relevant census volumes and reports. Summary data from the 1971 Census included here relate to basic characteristics available at the end of December 1972 (i.e., tenure, type of dwelling, number of rooms, bath and toilet facilities and running water). More detailed information on these particular housing characteristics, and on others such as home values and rents, household conveniences and mortgages, that may be available later may be obtained from the User Inquiry Service of the Data Dissemination Section, Census Branch, Statistics Canada.

14.2.1 Recent trends

The 1971 Census recorded a total of 6 million occupied dwellings in Canada. (A dwelling, for census purposes, is a structurally separate set of living quarters with a private entrance either from outside the building or from a common hall or stairway inside.) This total represented a 32.5% increase in dwellings since the 1961 Census, compared to an increase in population of 18.2%. It is apparent that, despite slower population growth resulting from declining birth rates and lower immigration, the need for dwellings has continued to increase at a rate comparable to the record growth rates of the 1950s. This is attributable largely to the increased rate of family formation as children of the postwar "baby boom" reached working and marriageable age, and to the establishment of increasing numbers of one- and two-person households in both younger and older age groups.

These trends in housing growth rates, including comparisons over the past 20 years for such characteristics as type of dwelling, tenure, number of rooms, and basic household facilities, are summarized in Table 14.4.

14.2.2 Dwelling types, tenure and size

14.2.2.1 Dwelling types

Single detached homes continued to be the predominant type of housing accommodation in Canada in 1971, although their relative numbers have gradually declined in favour of multiple type dwellings. Twenty years earlier, at the 1951 Census, two thirds of all dwellings were single detached, but this ratio gradually dropped to 59.5% by 1971. In the 1961-71 decade, single detached homes increased by 20.6%, whereas multiple type units, i.e., single attached (double and row houses), apartments, flats, etc., have grown at the significantly higher rate of 52.9%.

Table 14.5 shows the distribution of the two broad dwelling types in 1971 by province and by metropolitan area. Saskatchewan had the largest proportion of single detached homes, 81.5% of its occupied dwellings being in this category. Almost 60% of Quebec's dwellings were multiple type units (apartments, single attached, etc.), and only 40% were single detached, by far the lowest proportion among the provinces. The distribution within the major metropolitan centres reflected these provincial ratios in general terms, except that in most cases the proportions of multiple unit dwelling types were considerably higher than for the province as a whole. This was particularly evident in Montreal and Toronto, where only 23.7% and 45.9%, respectively, of all occupied dwellings were single detached homes.

14.2.2.2 Owner and tenant occupancy

The recent trend toward apartment living and higher density accommodation has resulted in a significant increase in the number of tenant-occupied dwellings (from 34.0% of all dwellings in 1961 to 39.7% in 1971), reversing an earlier trend which had seen the rate of home-ownership increase steadily from 56.7% of all homes in 1941 to 66.0% in 1961.

As in the case of dwelling types, there was considerable variation among provinces in the proportions of owner-occupied dwellings in 1971, ranging from a low of 47.4% in Quebec to a high of 80.8% in Newfoundland. Table 14.6 shows that the swing toward tenant occupancy in the 1961-71 period was characteristic of all provinces, and at a fairly uniform rate. However, the trend was less marked in New Brunswick and Quebec where the decline in the percentage of home-owners between 1961 and 1971 was not as sharp as in the other provinces.

Home-ownership is a characteristic which varies greatly between rural and urban areas and is generally in inverse ratio to the size of the community. For example, in the very large urban agglomerations of 500,000 population and over, only 46.1% of all dwellings were owner-occupied in 1971, compared with 63.2% for the urban size-groups under 100,000 population and 82.0% in rural areas. Among the various census metropolitan areas, the eastern centres of Halifax, Saint John, Montreal, Quebec and Ottawa - Hull showed the lowest percentages of home-ownership and the highest tenancy rates.

14.2.2.3 Dwelling size

Despite the high increase in apartment rental accommodation during the 1961-71 decade as compared to owner-occupied single homes, the average size of Canadian dwellings showed a slight increase from 5.3 to 5.4 rooms. Not all provinces followed this pattern, however, and as Table 14.7 shows, there was a decline in the average number of rooms per dwelling in all provinces east of Ontario, with increases in Ontario and throughout the west. Throughout the nation as a whole, Prince Edward Island had the highest average in 1971 at 6.1 rooms per

dwelling, and the Yukon Territory and Northwest Territories the lowest at 4.3. A "crowded" dwelling, for census purposes, is considered to be any dwelling in which the number of persons exceeds the number of rooms. Using this rough measure, the number of crowded dwellings decreased by 24.2% in the decade between 1961 and 1971. Perhaps even more significant is the fact that crowded dwellings fell from 16.5% of the total housing stock in 1961 to only 9.4% in 1971. This dramatic improvement, which was only slightly apparent in the 1951-61 period, appears to result from both a decline in the average number of persons per household and an increase in the average number of rooms per dwelling, with the former likely exerting the greater influence.

Provincially, the smallest proportions of crowded dwellings in relation to total housing stock were in Ontario and British Columbia, where only 6.8% of all dwellings had less than one room per person in 1971. The relatively largest proportions were in the Atlantic Provinces and Quebec, ranging from 12.4% in Nova Scotia and Quebec to 23.6% in Newfoundland.

14.2.3 Household facilities and equipment

14.2.3.1 Census data

Decennial censuses provide an inventory of a variety of household facilities and equipment to measure advances in living standards and to provide data for market research. The 1971 Census covered items such as plumbing and sanitary facilities, heating equipment and fuel, and accessories such as refrigerators, freezers, dishwashers, clothes dryers and television sets. Data on the first of these subjects, i.e., the incidence of homes with running water, bath and toilet facilities, are shown by province in Table 14.8.

Continuing the rising trend in recent decades, there was again a marked improvement in the number of dwellings equipped with plumbing and sanitary facilities during the 1961-71 period. Dwellings with running water increased from 89.1% of all dwellings in 1961 to 96.0% in 1971. Similarly, households reporting a bath or shower for their exclusive use advanced from 77.1% to 90.9%, and households with exclusive use of a flush toilet from 79.0% to 93.3%.

Although nine of every ten Canadian dwellings were supplied with these amenities in 1971, in rural localities the ratios were considerably lower than the national percentages. Table 14.8 shows that in rural areas of the Prairie Provinces, for example, one of every three dwellings still lacked running water and installed bath or shower facilities, and closer to one of every two lacked a flush toilet. Rural Newfoundland showed similar ratios, but in the Yukon Territory and Northwest Territories only about one rural dwelling in every three was equipped with these facilities.

14.2.3.2 Annual estimates

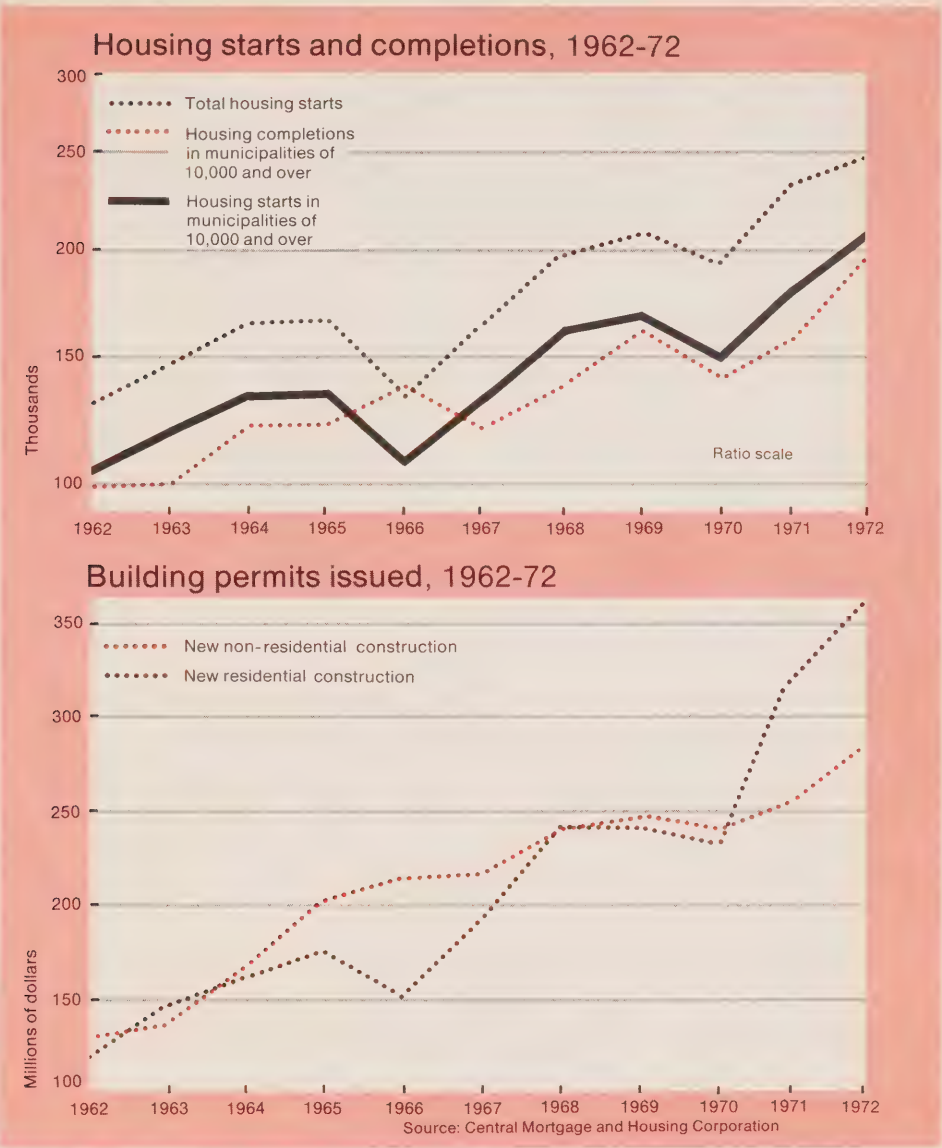

Table 14.9 presents some summary statistics derived from the latest in a series of annual sample surveys conducted by Statistics Canada. The survey was carried out in conjunction with the May 1972 labour force survey and about 30,000 households, chosen by area sampling methods, were included in the sample. Unlike decennial censuses, the sample survey cannot produce data for the smaller localities and areas, but much of the information shown in Table 14.9 for Canada is available also by individual provinces and metropolitan areas. Moreover, a much wider range of household facility and equipment items is covered in the annual survey than can be accommodated in a general census.

Table 14.9 shows that possession of colour television sets and FM radios by Canadian households increased more than any other item of equipment between May 1971 and May 1972. Households with colour TV sets increased to 24.2% of the total from 18.4%, and 62.4% had FM radios compared to 57.6% a year earlier. In 1972, data were collected for the first time on adult-size bicycles, 27.9%; pianos, 13.3%; portable humidifiers, 13.4%; and snow blowers, 4.6%. At the other end of the scale, several items of equipment now appear to be present in almost all Canadian households: electric refrigerators were reported in 98.7%; telephones in 94.6%; radios in 97.6%; and TV sets in 95.8%.

14.3 Construction

14.3.1 Value of construction work

The data on the construction industry represent the estimated total value of all new and repair construction performed by contractors and by the labour forces of utility, manufacturing, mining and logging firms, government departments, home-owner builders and other persons or firms not primarily engaged in the construction industry. Table 14.10

shows the value of new and repair construction work and Table 14.11 the value of such work performed by contractors and others during the period 1968-70, preliminary expenditures for 1971 and intentions for 1972. Table 14.12 gives estimates of total expenditures in Canada on each type of construction for which information is available.

Principal statistics of the construction industry are shown by province and for contractors, utilities, governments and others in Table 14.13. The statistics given for Canada as a whole may be considered as relatively accurate but those for individual provinces and by class of builder are approximations only. All estimates given for cost of materials used are based on ratios of this item to total value of work performed, derived from annual surveys of construction work performed by contractors and others, and applied to the total value-of-work figures. Estimates of labour content are similarly based but, in addition, are adjusted to include working owners and partners and their withdrawals. Although the ratios were calculated in some detail by type of industry, still further refinements are required. There are also some

difficulties in obtaining the precise location of projects undertaken or to be undertaken by large companies operating in a number of provinces. However, if used with these qualifications in mind, the Table provides useful estimates.

Price index numbers of construction and capital goods may be found in Chapter 21 which measure price changes in residential and non-residential building materials and changes in construction wage rates; price indexes of highway construction which show annual costs to provincial governments in contracts awarded for highway construction as a percentage of prices paid in 1961; and price indexes of electrical utility construction (distribution systems, transmission lines, transformer stations) which provide an estimate of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping such utilities.

14.3.2 Building permits issued

The estimated value of proposed construction is indicated by the value of building permits issued. Figures of building permits are collected from approximately 1,500 municipalities across the country and are available for individual municipalities, for metropolitan areas, for provinces and for economic areas in Quebec, Ontario and Manitoba.

The total value of permits issued for building construction in 1972 was \$6,409.3 million, a figure 12.2% higher than in 1971. Residential construction value and over-all non-residential construction value increased by 12.7% and 11.6%, respectively, reflecting an increase of 9.8% in the industrial, 30.4% in the commercial, and a decrease of 8.2% in the institutional and government construction sectors.

Permit values rose in all provinces except Prince Edward Island and Saskatchewan, which showed a slight decrease. The value of building permits issued in each province in the years 1971 and 1972 is given in Table 14.14, in each of 50 municipalities in Table 14.15 and in each of the 19 metropolitan areas in Table 14.16. The latter made up 65.2% of the 1972 total for Canada.

14.4 Capital expenditures

A survey carried out early in 1972 of capital spending intentions of all sectors of the Canadian economy indicated that capital outlays amounting to \$20,800 million were planned for 1972. The survey covered business establishments, institutions and all levels of government, and the total also included an estimate of outlays on new housing. The capital program anticipated for 1972 exceeded by about \$1,000 million or nearly 5%, the \$19,800 million spent for capital purposes in 1971. Within the total, outlays for new construction are expected to rise by about 4% and those for new machinery and equipment by about 6% from 1971 levels.

The planned 5% increase in capital expenditures in 1972 follows a year in which such outlays rose by 11%. Viewed within a longer term perspective, the indication is that the rate of growth in capital spending in 1971 was unusually high. Over the past decade, the average year-to-year growth rate in such spending was about 7%. If allowance is made for the usual build-up of investment plans from intentions as stated at the beginning of the year, present plans suggest that the 1972 growth in capital outlays will approximate this longer term norm.

Table 14.17 shows the trend in capital spending over the years 1961-72 in both current and constant (1961) dollars. Table 14.18 gives a summary of capital and repair expenditures by economic sector for 1970-72 and Table 14.19 contains details of the manufacturing, mining and utilities sectors.

A summary of the capital expenditures in each province for the years 1970-72 is given in Table 14.20. Such expenditures represent gross additions to the capital stock of the province and are a reflection of economic activity in the area, although the actual production of these assets may generate major employment and income-giving effects in other regions. For example, the spending of millions of dollars on plants and equipment in western Canada may generate considerable activity in machinery industries in Ontario and Quebec as well as construction activity in the western provinces.

Chapter 15

Transportation

15.1 Government promotion and regulation

The federal government plays a twofold role in developing transportation services. One is promotional – to ensure the growth and development of the kind of transportation appropriate to the times; the other is regulatory and includes economic regulation of rates and services and also the application of technical regulations to meet safety requirements. The building of canals from the time of Confederation to the construction of the St. Lawrence Seaway; underwriting railway development and branch-line extension; establishing Air Canada; investing in airports and aeronautical installations; and building the Trans-Canada Highway fall within the first category as the stated aim of each was to promote adequate transportation facilities.

The Ministry of Transport and the various Crown agencies reporting to Parliament through the Minister of Transport have jurisdiction over canals, harbours, shipping, civil aviation and interprovincial and international railways. Jurisdiction over for-hire interprovincial or international highway transport also rests with the federal government but these powers are at present exercised by the provincial highway transport boards as provided for in the federal Motor Vehicle Transport Act of 1954 (RSC 1970, c.M-14).

Railway regulation was developed in a period when railways enjoyed a virtual monopoly of transport in the country. Measures to protect the public against excessive charges, unjust discrimination and other objectionable monopoly practices, together with measures to ensure safe operations, have over the years subjected railways to the most comprehensive regulation of any Canadian industry. However, the rapid growth of road, air and pipeline services has ended the monopoly situation for a large part of the total traffic available and forced the railways into a highly competitive situation.

A Royal Commission was appointed in 1959 to inquire into the railway rate structure and other problems. Its findings indicated a need to shift from regulating monopoly to maintaining a balance between the competing modes of transport. Federal legislation based on the findings of the Royal Commission received Royal Assent on February 9, 1967. The National Transportation Act defines a national transportation policy for Canada with a view to achieving an economic and efficient transportation system making the best use of all available modes of transportation at the lowest total cost. The Act established the Canadian Transport Commission (CTC) to carry out the functions formerly performed by the Board of Transport Commissioners for Canada, the Air Transport Board and the Canadian Maritime Commission. In addition, it created a framework within which the CTC might regulate interprovincial and international motor transport as well as the transportation by pipeline of commodities other than oil and gas.

In general, the purpose of the Act is to develop the transportation industry and at the same time protect the public against excessive or discriminatory charges by competition between forms of transport rather than by regulation and control. The railways are relieved of some of the more onerous and outdated restrictions on their freedom to meet competition. On the other hand, a shipper who has no practical alternative to rail shipment can apply to the Commission to have a maximum rate fixed for transporting his goods. The Act also provides a procedure to allow railways, subject to explicit safeguards in the public-interest, to abandon lines and withdraw passenger services where they are no longer needed.

The Canadian Transport Commission has established several committees, four of which, Railway Transport, Air Transport, Water Transport and Telecommunications, exercise the Commission's powers in their respective industries. The Commission is a court of record; its decisions are binding within its jurisdiction and may be reviewed only by appeal to the Supreme Court of Canada on a question of law or jurisdiction with leave of that Court, or by the Governor in Council. However, a party to a licence application under the Aeronautics Act or the Transport Act may appeal to the Minister of Transport.

The Commission has jurisdiction under several Acts, including the Railway Act, the Aeronautics Act and the Transport Act, over transportation by railway, by air and by inland water, and over communication by telephone and telegraph.

Under the Railway Act the Commission has jurisdiction over construction, maintenance and operation of railways that are subject to the legislative authority of the Parliament of Canada, including matters of engineering, location of lines, crossings and crossing protection, safety of train operation, operating rules, investigation of accidents, accommodation for traffic and facilities for service, abandonment of operation and uniformity of railway accounting. The Commission also has certain jurisdiction over telephones and telegraphs, the tolls for which were re-defined by an amendment to the Railway Act in 1970 to include private wire, Telex and broadband exchange services operated by telecommunication carriers under federal jurisdiction. The jurisdiction includes regulation of the telephone tolls of Bell Canada because of the interprovincial nature of the company's operations and tolls for the use of international bridges and tunnels.

Except for certain statutory rates, and subject to certain powers of the Commission to deal with rates that it finds to be contrary to public interest, the railways are free to charge rates as they wish. However, rates must be compensatory, as defined in the Railway Act, and the Commission may prescribe tolls for captive shippers if such tolls take undue advantage of a monopoly situation favouring the railways.

The Commission is responsible for the economic regulation of commercial air services in Canada and is also required to advise the Minister of Transport on matters relating to civil aviation. The regulatory function relates to Canadian air services within Canada and abroad and to foreign air services operating in and out of Canada. It involves licensing all such services and regulating the licensees. The Commission issues regulations dealing with the classification of air carriers and commercial air services, accounts, records and reports, traffic tolls and tariffs, and various other matters. All regulations, rules and orders issued by the former Air Transport Board continue in force until repealed or amended by the Commission.

The CTC takes an active part in the work of the International Civil Aviation Organization and, when appropriate, undertakes bilateral negotiations for the exchange of traffic rights. In 1972, Air Canada and CP Air were Canada's designated international scheduled carriers.

Under the Transport Act, the Commission entertains applications for licences for ships to transport goods or passengers for hire or reward between places in Canada on the Great Lakes and on the Mackenzie and Yukon rivers, except goods in bulk on waters other than the Mackenzie River. Before granting a licence, the Commission studies the need for such transport and afterward retains regulatory powers over tolls to be charged.

The Commission is authorized to investigate complaints about proposed tariffs, under terms of the Pilotage Act, and about existing tariffs under the St. Lawrence Seaway Authority Act, and to make recommendations to the appropriate body. Under the Shipping Conferences Exemption Act, ocean carriers who are members of a shipping conference must file copies of their agreements, tariffs and other such documents with the Commission.

The CTC also administers subsidies paid by the federal government for maintaining certain coastal and inland water shipping services. Table 15.1 shows the net amount of these subsidies paid in the year ended March 31, 1972.

15.2 Rail transport

Canadian railway transport is dominated by two transcontinental systems, supplemented by a number of regional railways. The government-owned Canadian National Railway System is the country's largest public utility and operates the longest track mileage in Canada. It serves all ten provinces as well as the Great Slave Lake area of the Northwest Territories. In addition, it operates a highway transport service, a fleet of coastal steamships, a chain of large hotels and resorts, a telecommunications service, and, as an autonomous subsidiary (Air Canada), a scheduled Canadian and international air service. The Canadian Pacific Railway Company is a joint-stock corporation operating a railway service in eight provinces. Similar to and competitive with the Canadian National Railway System, it is a multi-transport organization with a fleet of inland and ocean-going vessels as well as coastal vessels, a chain of year-round and resort hotels, a telecommunications service, and a domestic and foreign airline service. The British Columbia Railway (formerly the Pacific Great Eastern Railway) operates over a 1,000-mile route from North Vancouver to Fort Nelson in northeastern British Columbia. The Northern Alberta Railway, jointly owned by CP and CN, serves the area north of Edmonton with a 900-mile system. Northern Ontario is served by the provincially owned Ontario Northland Railways with a 600-mile system stretching from North Bay to Moosonee,

and by the privately owned Algoma Central Railway operating over 300 miles of line between Sault Ste. Marie and Hearst.

In 1972 a new US - Canada passenger service was inaugurated by the National Railroad Passenger Corporation (AMTRAK). AMTRAK's first international train — the "Pacific International" — made its initial run July 17, between Seattle, Wash. and Vancouver, BC. Its Montreal to Washington service via New York City, Springfield, Mass., and resort areas in New Hampshire and Vermont began September 29, 1972.

The largest contributors to Canada's total 1971 railway revenue were Canadian National (51.1%) and Canadian Pacific (36.5%). The Quebec North Shore and Labrador Railway, built primarily to transport ore and concentrates from the iron mines of the Schefferville and Wabush areas of Quebec and Labrador to water transportation facilities on the St. Lawrence River, accounted for 2.9% of the revenues. Other railways contributing 1.0% or more of the total revenue figure were the British Columbia Railway (2.1%) and the Ontario Northland (1.1%).

In recent years the railways have faced strong competition from highway and air transport for the movement of people and goods. Still indispensable for carrying bulk commodities, railways are necessary to the development of natural resources located in isolated areas of Canada. Only pipelines have competed with railways in this respect by providing an economical means of transporting the products of oil and gas fields for long distances overland.

The rapid growth of containerization in recent years has made the integration of the services of railway, highway, shipping and other modes of transport of growing importance. However, because Canada's two major railways are already involved in several forms of transportation, they are in an excellent position to meet the challenge of this and other trends appearing in the transportation industry. Canadian railways have evolved over the past century from a position of virtual monopoly in the movement of goods and people by rail, through a highly competitive stage to the present system of co-operation and co-ordination with other modes of transport. The latter approach permits each type of transport to perform the particular function it can do best, thus establishing the most effective and economical system of transportation services possible.

15.2.1 Government aid

In the nineteenth century governments promoted the building of railways to provide transportation and communication across Canada. Private developers received assistance in the form of land grants, cash payments, loans or purchase of shares. Since the formation of the Canadian National Railway System, its debenture issues, except those for rolling-stock, have been guaranteed by the federal government. Provincial governments had guaranteed the bonds of some lines that were later incorporated in the CNR System. As these mature or are called, they are paid off by the CNR in large measure through funds raised by issuing new bonds guaranteed by the federal government. At December 31, 1972, railway bonds guaranteed by the Government of Canada amounted to \$810 million.

The National Transportation Act provides for normal railway subsidy payments of \$110 million for 1967, declining by \$14 million per year, the last payment being \$12 million for 1974. The Act also allows railways to file claims and receive specific payments for losses incurred on branch lines and passenger-train services operated in the public interest. Total payments of \$81.7 million for 1971 represented specific payments to the two major railways, exceeding and replacing their shares of the normal subsidy. Claims for 1972 must be filed by June 30, 1973.

Truckers receive federal assistance through freight rate subsidies similar to the subsidies to railways provided under the Maritime Freight Rate Act. Since 1969 the Atlantic Region Freight Assistance Act has allowed subsidies on goods moved from Nova Scotia, Prince Edward Island, New Brunswick, the island of Newfoundland, and Quebec south of the St. Lawrence River and east of Highway 23 to points in Canada outside that territory. In October 1970 assistance was authorized for goods moved by highway transport within that area as well.

15.2.2 Rail transport statistics

Track mileage and rolling-stock. Total railway track mileage in Canada has changed little since the 1920s. Table 15.2 illustrates the historical development of first main track mileage from 17,657 miles in 1900 to 38,805 in 1920 and to 44,153 in 1971. The same Table presents

statistics on main and other types of track mileage by province and territory and that operated by Canadian carriers in the US for the years 1967-71.

Table 15.3 compares freight and passenger equipment in operation in 1970 and 1971 with that in use in 1960. Privately owned cars, which include cars owned by non-rail industrial firms such as oil, chemical and railway car leasing companies that furnish freight cars to, or on behalf of, any railway line, have increased greatly in number. The figures given of rolling-stock in operation do not reflect, however, the offsetting trend toward larger, more efficient cars and locomotives or the steady improvement in speed of movement facilitated by modernized handling and terminal services. Each year, hundreds of units, particularly freight cars, are converted and modified to make them suitable for specific types of traffic or are replaced by special-purpose equipment designed for distinctive hauling jobs. The average capacity of all freight cars was 59.1 tons in 1971 compared with 51.4 tons in 1960. Also, although the number of diesel-electric locomotives in service has remained fairly constant over this period, it should be noted that an extensive program of power upgrading has been followed by the railway companies.

Revenue freight. Total tonnage of freight carried by all common carrier railways (including national loadings and receipts from US connections) in 1970 and 1971 is shown in Table 15.4 under the commodity structure adopted in 1970 based on Statistics Canada's Standard Commodity Classification. Although there is some loss of continuity with previous data, this new commodity breakdown permits improved comparisons with other series on water transport, imports, exports, etc., which are already based on the Standard Commodity Classification.

Capital structure and finance. Tables 15.5-15.8 give information on capital investment in road and equipment, and on operating revenues, expenses and net income of all common carrier railways operating in Canada, except that of the Cartier Railway which is not available. A Uniform Classification of Accounts has been in operation for the Canadian National and the Canadian Pacific Railways since January 1, 1956 and for other common carrier railways since January 1, 1957. In transportation statistics, a distinction is made between expenditures and expenses. In the following data, the term "expenses" is used as defined in the Uniform Classification of Accounts and refers to the expenses of furnishing rail transportation service and of operations incident thereto, including maintenance and depreciation of the plant used in such service.

The capital structure of the Canadian National Railway System is presented in Table 15.6 and financial details of operations in both Canada and the United States in Table 15.7. Revenues and expenses include those of express and commercial communications and highway transport (rail) operations. To conform to the requirements of the Uniform Classification of Accounts adopted January 1, 1956, tax accruals and rents are charged to operating expenses.

Total operating revenues and expenses of common carrier railways operating in Canada (except the Cartier Railway) continued to rise, both reaching peak levels in 1971; increases over 1970 amounted to 7.5% and 7.9%, respectively (as calculated from Table 15.8). As a result, net operating revenues showed a rise of 11.8% to \$107.5 million.

15.3 Road transport

The federal government establishes motor vehicle safety standards, while registration of motor vehicles and regulation of motor vehicle traffic lie with the legislative jurisdiction of the provincial and territorial governments. An outline of legislation, as well as summaries of motor vehicle and traffic regulations common to all provinces and territories are presented in the following Sections.

15.3.1 Federal safety regulations

The general objective of the Motor Vehicle Safety Act (RSC 1970, c.26, 1st Supp.) is to establish mandatory safety standards for new motor vehicles in order to protect the public from the effects of exhaust emissions and noise. The legislation applies to all new motor vehicles and components manufactured in or imported into Canada, and requires manufacturers to issue notices of safety defects in a prescribed manner. The safety of vehicles in use continues to be a provincial responsibility discharged under existing provincial legislation.

The safety regulations currently include 35 standards relating to the design and performance of passenger cars, trucks, buses, motorcycles, competition motorcycles, minibikes and trailers; six standards limiting motor vehicle exhaust, evaporative and noise emissions; and ten standards applying to snowmobiles. These standards will be reviewed regularly and additions or revisions incorporated to keep pace with engineering or technical advances. The regulations require all Canadian motor vehicle manufacturers or distributors to apply the national safety mark, accompanied by a label certifying compliance with all applicable federal motor vehicle safety standards, to every classified vehicle produced after January 1, 1971. Vehicles imported for commercial or individual use must comply with the Act and Regulations.

15.3.2 Motor vehicle and traffic regulations

Operators licences. The operator of a motor vehicle must be over a specified age, usually 16 years (17 in Newfoundland and generally 18 in Alberta but 16 for certain classes of motor vehicle), and must carry a licence, obtainable in most provinces only after prescribed qualification tests. A licence is renewable annually in Saskatchewan, the Yukon Territory and the Northwest Territories and annually at the end of the licensee's birth month in Manitoba; in Alberta it is renewable every five years but annually where a medical report is required; in British Columbia, it is renewable every five years expiring on the licensee's birth date and classified according to the operations by the licensee; in Quebec, operators and chauffeurs permits are renewable every two years on the holder's birthday; in New Brunswick a licence is renewable every two years and expires at the end of the licensee's birth month; in Newfoundland and Ontario a licence is issued on a three-year basis and expires on the licensee's birth date; and in Nova Scotia a licence is issued on a three-year basis and expires at the end of the licensee's birth month. Prince Edward Island is phasing into a three-year cycle.

Special licences are required for chauffeurs in all provinces except Newfoundland and British Columbia. In the Northwest Territories, persons under 18 but over 16 may obtain a chauffeurs licence at the discretion of the Registrar, on receipt of a letter of approval from the RCMP and a letter from the employer verifying that the licence is necessary for employment. In most provinces, a motorcycle operator is required to pass a special examination and have his driver's licence endorsed authorizing him to operate this class of vehicle or, if he has no driver's licence, he may be issued a licence to operate only a motorcycle. In Alberta a person under 16 but over 14 years of age is permitted to operate a motorcycle with a piston displacement of not more than 100 cc. Under regulations recently adopted in Quebec, all snowmobile operators must hold valid permits issued for that purpose. Operators or chauffeurs permits issued under the Highway Code are considered valid for snowmobiles. Special restrictions apply to minors; ten is the minimum age for obtaining a permit and operating conditions and locations are controlled.

Motor vehicle regulations. Motor vehicles and trailers are usually registered annually with the payment of specified fees. Most motor vehicles carry a registration plate on the front and one on the rear; trailers carry one on the rear.

In most provinces registration plates stay with the vehicle when it is sold, but in Quebec, Manitoba, Saskatchewan and Alberta the owner retains them. In the Northwest Territories a vehicle's registration expires when it changes hands. The owner notifies the Registrar, returns the number plates and the new owner applies to register the transferred vehicle in his name. In Nova Scotia, vehicles change hands by due process of law and title must be secured before plates and permit are issued. A change of ownership must be recorded with the registration authority.

Exemption from registration is granted for a specified period, usually at least 90 days, although the maximum in Quebec is three months for non-residents. In Nova Scotia, a non-resident full-time student residing temporarily in the province may receive, without fee, a driver's licence, plates and permit in exchange for the same valid out-of-province documents; the latter are returned to his home province, state or territory. In Ontario the exemption period is six consecutive months for non-residents from other provinces and three for those with vehicles registered outside Canada. The regulations in Manitoba allow residents to use registration plates from other jurisdictions for 90 days; visitors are exempt from registration if the vehicle is not used for business; and an out-of-province student is exempt if his vehicle is properly registered in his home jurisdiction and he obtains a student sticker for the vehicle's

windshield. In Saskatchewan an out-of-province student is exempt for the school year provided the vehicle is properly registered in his home jurisdiction and, if necessary, he can prove financial responsibility. The Alberta regulations permit non-residents to operate vehicles currently registered in their home province or in the United States for six months; the period is extended to a school year for out-of-province students whose vehicles carry non-resident student stickers. In British Columbia the exemption period is one month; tourists are allowed six months and out-of-province students, a school year, if the vehicles are properly registered in their home jurisdictions.

Safety regulations require vehicles to meet certain mechanical and braking standards and stipulate that equipment include non-glare headlights, a proper rear light, a muffler, a windshield wiper, a rear-vision mirror and a horn. In Ontario and Manitoba, a certificate of mechanical fitness is required before a vehicle sold on the second-hand market can be issued a permit for operation. At the time of sale, used car dealers must certify that the vehicle complies with the provincial equipment requirements. In Alberta the dealer must issue a certificate indicating whether or not the vehicle complies with the prescribed equipment regulations.

Traffic regulations. In all provinces and territories, vehicles keep to the right-hand side of the road. Everywhere motorists are required to observe traffic signs, lights, etc., placed at strategic points on highways and roads. The speed limit in Prince Edward Island, unless otherwise posted, is 60 mph in daytime and 55 at night; in Manitoba, the basic speed limit is 60 mph in daytime and 50 at night unless otherwise posted — speed limits may be raised to 70 mph or modified in semi-built-up areas; in Alberta it is 60 in daytime and 50 at night, with the exception of a few selected sections of four-lane highway where higher speeds may be posted; in Nova Scotia the limit is a “reasonable and prudent” speed, with a maximum of 60 mph except where 65 mph is authorized; in New Brunswick, maximum speeds vary from 50 to 60 mph depending on the type of highway; and in Ontario and Quebec maximum speeds vary from 50 to 70 mph, depending on the type of highway. In the other provinces the maximum speed permitted is normally 50 mph; in Saskatchewan and British Columbia where higher speeds are in effect they are posted. In the Yukon Territory the speed limit for all vehicles is 60 mph, unless otherwise posted. In the Northwest Territories, the highway limit is 60 mph for all vehicles, day or night, except as otherwise posted, and in municipalities it is 30 mph except as posted. Slower speeds are required in cities, towns and villages, at road intersections, railway crossings or at other places or times where the view of the highway for a safe distance ahead is in any way obscured. In Nova Scotia, British Columbia and the Northwest Territories slower speeds are also required in school zones and when passing public playgrounds. Most provinces require vehicles to stop when a school bus is stopped to load or discharge children. Truck speed limits are at least five miles per hour below automobile speed limits, although in Manitoba, Saskatchewan and British Columbia they are the same as for passenger vehicles. In most provinces, accidents resulting in personal injury or property damage in excess of \$200 (\$100 in Quebec where snowmobiles are subject to a similar regulation) must be reported to a police officer (in Nova Scotia to the Registrar of Motor Vehicles or to a police officer; in Quebec to a police officer or to the Motor Vehicle Bureau) and a driver involved must not leave the scene of an accident until he has rendered all possible aid and disclosed his name to the injured party.

Driver licensing controls. All provinces and territories impose penalties for infractions of driving regulations, ranging from fines for minor infractions to suspension of the operator's driving permit, impounding of vehicle or imprisonment for more serious infractions. In most provinces penalties have been linked to a driver-improvement program, the aim of which is to correct faulty driving habits, not to take drivers off the road. The most common driver-improvement program includes the demerit-point system.

Safety responsibility legislation. Each province has enacted safety responsibility legislation. In general, laws provide for the automatic suspension of the driver's licence and motor vehicle registration of a person convicted of a serious offence (impaired driving, driving under suspension, dangerous driving, etc.) or a person whose uninsured vehicle is involved directly or indirectly in an accident resulting in damage in excess of \$200 or injury or death to any person (in Manitoba the amount is \$100 and in Nova Scotia, \$50). In Saskatchewan, Alberta, Quebec and Nova Scotia, if a judgement is rendered for damages against the driver or owner, the driver's licence and registration remain suspended until the judgement is satisfied and, except

in Alberta, proof of financial responsibility for the future is filed. In Saskatchewan and the Northwest Territories uninsured motor vehicles may be impounded following an accident of any consequence, i.e., an accident resulting in personal injury or death, or property damage in excess of \$200. Under the Quebec Code of Civil Procedure, before judgement the plaintiff may seize the motor vehicle which has caused him damage, whatever the amount of property damage, whether covered for third-party insurance or not. In British Columbia, if a judgement is rendered against a driver and not satisfied, the driver's licence may be suspended until reinstated at the discretion of the Superintendent of Motor Vehicles. In the Yukon Territory an inadequately insured vehicle may be impounded if it is involved in an accident, regardless of the property damage.

In Ontario, Manitoba, Alberta and British Columbia the non-resident motorist is not required to carry or produce any form of proof of insurance. In Ontario, the only persons required to file a Certificate of Insurance are those indebted to the Motor Vehicles Accident Claims Fund. If asked by police, registered owners in Nova Scotia must show proof of financial responsibility or face possible prosecution. Conviction results in suspension of both driver's licence and registration until proof of financial responsibility is filed. In British Columbia, Alberta and Manitoba, a compulsory insurance plan is in effect for residents, and drivers may at any time be required to show proof of financial responsibility on demand of a peace officer. In the Northwest Territories proof of insurance must be supplied before vehicle licence is issued, and when the insurance expires or is cancelled vehicle licence plates must be returned to the Registrar of Motor Vehicles. In both the Yukon and the Northwest Territories, certain areas may be exempted from the insurance requirement on order of the Commissioner. In the Northwest Territories, public liability and property damage insurance is compulsory for all vehicles operating on the highways of the Territories regardless of where the vehicle is registered. In Quebec snowmobiles are required to carry insurance in the amount of \$35,000 to cover liability deriving from the use of such vehicle.

Unsatisfied judgement fund. All provinces and territories, except Manitoba, Saskatchewan and the Yukon Territory, have enacted legislation providing for the establishment of a fund, frequently called an unsatisfied judgement fund (in New Brunswick, the Unsatisfied Judgement; in Ontario and Alberta, the Motor Vehicle Accident Claims Fund; and in British Columbia, the Traffic Victims' Indemnity Fund). Judgements awarded for damages arising out of motor vehicle accidents which cannot be collected by the ordinary process of law are paid out of this fund. In Newfoundland, Prince Edward Island, Nova Scotia, Quebec and British Columbia the fund is maintained by insurance companies. In all the other provinces, except Saskatchewan and Manitoba where insurance is compulsory, the funds are obtained by collecting an annual fee from the registered owner of every motor vehicle or from every person to whom a driver's licence is issued. The fee usually does not exceed \$1 per annum; in New Brunswick the fee is \$3 per year; in Ontario a fee of \$25 is paid by the uninsured motorist (in the absence of the fee being paid, the uninsured, if apprehended, is liable to a fine) and, in addition, the fund is subsidized by a \$1 annual charge from each licensed driver.

Some provincial legislation covers payment of judgements in hit-and-run accidents. When these occur, if neither the owner nor the driver can be identified, action may be taken against the Registrar of Motor Vehicles (the Minister of Finance in Newfoundland and the Administrator of the Motor Vehicle Accident Claims Fund in Alberta); any judgement secured against the responsible authority is paid out of the fund. The amount that can be paid out of the fund on one judgement is limited. In Newfoundland and Nova Scotia, the limits are \$10,000 for one person, \$20,000 for two or more persons injured in one accident and \$5,000 for property damage. In Nova Scotia and New Brunswick, the limit is \$35,000 in respect of any one accident. In Prince Edward Island and Quebec, the limit is \$35,000 for all damages in the same accident, subject to a deduction of \$200 from all damage to the property of others; damages resulting in bodily injury or death are, up to \$30,000, payable by priority over damages to property and the latter are, up to \$5,000, payable by priority over the former out of the amount of any insurance or other guarantee of indemnity. In British Columbia, the limit is based on the single amount of \$50,000 for any one accident with the provision that not more than \$5,000 may be paid on a property damage claim until injury claims up to \$45,000 have been satisfied; the \$50,000 limit exists for hit-and-run accidents but does not apply to payments for property damage. In Alberta, the limit is \$35,000 for death or personal injury to one or more persons and

\$5,000 for damage to property, subject to a limit of \$35,000 in any one accident; where, in one accident, claims result from bodily injury to or death of one or more persons and loss of or damage to property, claims arising out of bodily injury or death have priority over claims resulting from loss of or damage to property to the amount of \$30,000, and claims arising out of loss of or damage to property have priority over claims resulting from bodily injury or death to the amount of \$5,000. In Ontario the limits are \$50,000, inclusive of \$5,000 for any property damage claim. Many small claims are handled by the Motor Vehicle Accident Claims Branch (under the Ministry of Consumer and Commercial Relations), subject to a \$50 franchise clause in respect of property damage, but the procedure is such that claims can be settled without resort to litigation. The Minister has the power to act where the defendant is an infant or the defendant owner or driver is deceased.

15.3.3 Road transport statistics

15.3.3.1 Highways, roads and streets

At the end of 1970 Canada had 317,116 miles of highways and rural roads under federal or provincial jurisdictions and 198,806 miles of roads and streets under municipal jurisdiction. Roads in municipalities of less than 1,000 population are now included under municipal rather than rural (Table 15.9). Most of this mileage is in the more populated sections. Roads built by logging, pulp and paper, and mining companies provide some access to remote communities but large areas of most provinces and the territories are still very sparsely settled and are virtually without roads.

Table 15.10 presents expenditure data for all highways, roads and streets in 1969-70 and 1970-71. In 1970-71 total expenditures equalled \$2,101 million; construction expenses and maintenance and administration costs each increased by 7.4%.

15.3.3.2 Motor vehicles

Registrations continue to increase yearly, a record of 9 million being reached in 1971. Of that total, 7 million were passenger cars. Registrations by province are given in Table 15.11 and types of vehicles registered by province in Table 15.12.

Provincial government revenue. The taxation of motive fuels, motor vehicles, garages, drivers, chauffeurs, etc., is an important source of provincial government revenue. In every province, licences or permits issued by the provincial authorities are required for motor vehicles, trailers, operators or drivers, paid chauffeurs, dealers, garages and gasoline and service stations.

The more important sources from which provincial revenue from motor vehicles is derived are shown in Table 15.13. Motive fuel tax rates and federal government revenue from excise and sales taxes are given in Chapter 20.

Sales of motive fuels for motor vehicle use are taxable. To estimate the amount of fuel sold for motor vehicles, tax-exempt sales to the federal government and other consumers, exports and sales on which tax refunds are paid are eliminated from the gross sales. As shown in Table 15.14, consumption of taxable gasoline, which is used almost entirely for automotive purposes, rose 4.4% in 1971 and net sales of diesel oil 17.5%.

Freight carriers. Table 15.15 presents summary statistics on revenues, expenditures, equipment, employees, etc., tabulated from data reported by 1,200 common carriers and 826 contract carriers in 1970 and 1,301 and 913, respectively, in 1969.

Household goods movers and storage operators. In Table 15.16 statistics of movers and storage operators are summarized from data reported in the years 1966-70. In 1970, 263 companies reported a total net revenue of \$2.3 million and investments in land, warehouses, etc., of \$46.6 million.

Passenger buses. The operations of companies predominantly engaged in passenger bus service are summarized in Table 15.17 for the years 1966-71. Data refer to the for-hire segment of the industry. Only firms engaged in intercity and rural operations and having annual gross revenues of \$6,000 or over are covered. Operators predominantly involved in providing school bus service are not included nor are airport servicing and urban transit bus operators. In 1971, 145 carriers reported total net revenues of \$14.2 million and fixed assets of \$118.1 million.

Urban transit systems. Statistical information on urban transit systems presented in Table 15.18 includes operations of motor buses, trolley coaches, streetcars and subway cars carrying passengers in urban and suburban service, 1966-70. There are two subway systems in operation

in Canada: the Toronto subway was officially opened on March 30, 1954 and the Montreal subway began public operation on October 17, 1966.

15.4 Water transport

The Canada Shipping Act (RSC 1970, c.S-9) is the most significant statute dealing with shipping. Other important legislative measures include the Pilotage Act, the Arctic Waters Pollution Prevention Act and the Navigable Waters Protection Act. Under the Canada Shipping Act and its amendments, the Parliament of Canada has complete jurisdiction over the regulation of shipping in Canadian-controlled waters.

15.4.1 Shipping

Except in the case of the coastal trade, all Canadian waterways, including canals, lakes and rivers, are open on equal terms to the shipping of all countries of the world so that Canadian shipping must compete with foreign flag shipping.

The carriage of goods and persons from one Canadian port to another Canadian port, commonly referred to as the coastal trade, is restricted to ships registered in Canada within the region from Havre St. Pierre on the St. Lawrence River upstream to the head of the Great Lakes. Elsewhere in Canada, the coastal trade is restricted to ships registered in a Commonwealth country.

Canadian registry. Under Part I of the Canada Shipping Act, ships in excess of 15 registered net tons and pleasure yachts in excess of 20 tons net must be registered; ships of lower tonnage may be registered or otherwise licensed if powered by a motor of 10 hp or more. Section 6 of the Act restricts ownership to British subjects or corporate bodies incorporated under the law of a Commonwealth country or the Republic of Ireland which have their principal place of business in those countries. Under the British Commonwealth Merchant Shipping Agreement, all Commonwealth ships are designated "British Ship", and non-registered ships that should be registered do not acquire the privileges accorded British ships. Ships in the construction or planning stages may be recorded before registry by a Registrar of Shipping at one of the 75 Ports of Registry in Canada.

Vessels on the Canadian shipping registry. As at December 31, 1972, there were 28,584 ships constituting 3.9 million gross tons registered in Canada. This represents an increase over the previous calendar year of 541 ships and 118,019 gross tons.

Shipping traffic. Table 15.19 shows the number and tonnage of all vessels (except those of less than 15 registered net tons, naval vessels and, for 1962-70, fishing vessels) entering Canadian customs and non-customs ports.

Freight movements through large ports take different forms, including cargoes for or from foreign countries and cargoes loaded and unloaded in coastwise shipping, i.e., domestic freight moving between Canadian points. Table 15.20 presents data by province on cargoes loaded and unloaded from vessels in international or coastwise shipping. In 1970 a total of 290.7 million tons were loaded or unloaded at the principal Canadian ports, compared with 249.0 million tons in 1969. In-transit movement in vessels that pass through harbours without loading or unloading and movements from one point to another within harbours are also numerous in many ports.

Shipping statistics, which cover traffic in and out of both customs and non-customs ports, do not include freight in transit or freight moved from one point to another within the harbour. Table 15.21 shows the principal commodities loaded and unloaded in international and coastwise shipping at the 17 ports handling the largest cargo volumes in 1970. These ports handled 77.9% of all Canada's international shipping and 58.4% of the coastwise trade. The specific commodities shown are those transported in volume and often in bulk form.

15.4.2 Ports and harbours

The ports and harbours of Canada comprise 25 large multi-purpose ports, some 300 smaller ports, and several hundred wharves on the east coast, the Great Lakes, the west coast, in the Arctic, and on interior lakes and rivers.

The administration of Canadian ports is generally under the Ministry of Transport's Canadian Marine Transportation Administration formed in 1970. Canada's harbours are subdivided into National Harbours Board ports, harbour commissions, public harbours, and government wharves.

The National Harbours Board, a Crown corporation, is responsible for administering the Jacques Cartier and Champlain bridges at Montreal, the grain elevators at Prescott and Port Colborne, Ont. and port facilities such as wharves and piers, transit sheds, grain elevators, etc. at the harbours of St. John's, Nfld.; Halifax, NS; Saint John and Belledune, NB; Chicoutimi, Quebec, Trois-Rivières and Montreal, Que.; Churchill, Man.; and Vancouver and Prince Rupert, BC. The number of vessels and the amount of tonnage handled at these ports in 1971 and 1972 are reported in Table 15.22.

The capital values of fixed assets administered by the Board amounted to almost \$420.0 million at December 31, 1971 and \$421.0 million at December 31, 1972; these figures include expenditures on all buildings, machinery and durable plant improvements less deductions for depreciation, and represent a fair approximation of the properties' present value. During 1971, the federal government advanced \$3.1 million to the National Harbours Board for capital expenditures of \$1.1 million at Halifax and \$2.0 million at Vancouver.

Harbour commissions. Eleven of Canada's major multi-purpose harbours are administered by harbour commissions under the general supervision of the Ministry of Transport. These ports include The Lakehead (Thunder Bay), Windsor, Hamilton, Toronto, Oshawa and Belleville, Ont. on the Great Lakes; Winnipeg - St. Boniface, Man. on the Red River - Lake Winnipeg System; Fraser River (New Westminster), North Fraser, Nanaimo, and Port Alberni, BC. The harbour commissions include municipal as well as federal appointees, and are responsible for regular administration, operation, and maintenance as well as for maintaining close liaison with the Ministry of Transport and with the regional and local interests they serve.

Public harbours. More than 300 public harbours are directly administered by the Canadian Marine Transportation Administration. Harbour masters and wharfingers are appointed by the Minister of Transport. Some of the larger public harbours include Sept Îles, Que.; Corner Brook, Nfld.; Sydney and Port Hawkesbury, NS; Sault Ste. Marie and Goderich, Ont.; and Victoria, BC.

Government wharves. The Canadian Marine Transportation Administration is responsible for several hundred government wharves used for commercial and multi-purpose traffic. Most of these are in public harbours. Federal ferry wharves are administered by the Ministry's Canadian Surface Transportation Administration. In addition, provincial governments administer many ferry wharves for intraprovincial services.

The Ministry of Transport is responsible for providing adequate public port facilities to serve commercial interests using water transportation. It also determines when to expand or phase-out facilities in response to economic growth or changes in cargo traffic patterns resulting from new industries, trends to new types of ships, and new developments in freight handling. The Ministry ensures that the intermodal transfer operations of goods and passengers between vessels and shores meet modern standards and that infrastructures are adequate for needs in all parts of Canada. In accord with the National Transportation Policy the Ministry establishes and collects fees from users of port facilities under its jurisdiction.

Private facilities. In addition to public facilities, there are extensive wharf and associated cargo handling facilities owned by private companies, particularly specialized facilities for handling coal, iron ore, petroleum, grain and pulpwood. At Sept Îles, Que. for example, the Iron Ore Company of Canada Limited owns and operates very extensive private facilities to load pelletized iron ore onto ocean-going and Great Lakes vessels. At Port Hawkesbury, NS, Gulf Oil Canada Ltd. operates a terminal to unload tankers of 325,000 tons deadweight or larger; in Quebec City, Canadian Pacific operates a container terminal at Wolfe's Cove; and at Kitimat, BC, the Aluminum Company of Canada Limited operates a multi-purpose terminal to service smelter operations there.

Administrative developments. A task force on harbour administration was set up in 1970 under the Marine Transportation Administration to review the existing port system under the Ministry of Transport and the National Harbours Board. In May 1971, the Minister of Transport announced a new Canadian port policy providing for greater local participation in management at the National Harbours Board ports through new Local Port Authorities. The policy also provided for the establishment of a National Port Council, with membership on a nationwide basis, to act as an over-all advisory body to the Canadian Marine Transportation

Administration. An interdepartmental Ports and Harbours Planning Committee was established by Cabinet to review all major development proposals in National Harbours Board and Commission ports as well as at public harbours and government wharves. The National Port Council met for the first time in September 1972 and will make recommendations to the administrator on many aspects including the future administrative status of ports in Canada.

New developments in shipping. The trend to larger, more sophisticated ships and specialized carriers is continuing. Deep-water oil terminals now in operation at Port Hawkesbury, NS, and Mispic Point, NB, regularly accept tankers of 250,000 tons deadweight or more. Port Hawkesbury handled the largest vessel ever to cross the Atlantic, the 327,000-ton *Universe Japan*. A third such terminal is being completed at Come-by-Chance, Nfld. Dry-bulk carriers of 150,000 tons regularly load at the National Harbours Board terminal at Roberts Bank, under the administration of the Port of Vancouver, and 100,000-ton vessels will shortly be able to reach Quebec City. New facilities at Sept Îles, Que. will soon permit loading of ore carriers up to 250,000 tons.

The role of containerization continues to expand, bringing significant changes in cargo routing and handling. Major container terminals are situated at Saint John, Halifax, Quebec, Montreal and Toronto, and in Vancouver and Fraser River (New Westminster, BC). Both CP Rail and Canadian National operate fast container-trains between these ports and inland centres in Canada and the United States.

The new container ships travel at speeds up to 33 knots and port turnaround time is critical to the economics of operating them. Consequently highly specialized port facilities are constantly being upgraded and made more efficient by the installation of special ramps for roll-on roll-off vessels; large container cranes which can handle 20 or more 15-ton containers per hour; special container packing facilities; large open storage areas for containers, automobiles, lumber, and bulk products such as coal; rail and truck loading and unloading facilities, etc.

Investment in ports is increasing as larger ships require facilities farther from shore, channel dredging, larger turning basins, and more sophisticated systems of navigational and traffic control aids. In addition, environmental considerations often require that the least expensive alternative for terminal construction be rejected in favour of an environmentally more acceptable, but more costly, one.

In addition to these developments, port facilities and ancillary industrial facilities are moving away from urban centres, returning waterfront lands to public residential, commercial and recreational use. In Toronto, for example, the core of the port facilities has gradually moved from the downtown area eastward and an entirely new "outer harbour" basin has been constructed in Lake Ontario. Concurrently, much of the old waterfront property is being filled, and construction of a \$250 million residential, hotel, office, and recreational complex known as Harbour Square is under way.

15.4.3 The St. Lawrence Seaway

Events leading up to the beginning of the St. Lawrence Seaway project and the progress made during the years of its construction are covered in earlier editions of the *Canada Year Book*. The 1956 edition (pp. 821-829) gives detailed information on Great Lakes - St. Lawrence waterway traffic immediately before construction began on the project and the 1960 *Canada Year Book* (pp. 851-860) relates the story of the Seaway during the second year of its operation. The first decade of Seaway development and operations is discussed in the 1969 edition (pp. 841-845).

The St. Lawrence Seaway Authority, constituted as a corporation by Act of Parliament in 1951, undertook the construction (and subsequent maintenance and operation) of Canadian facilities between Montreal and Lake Erie to allow navigation by vessels of 27-foot draft. At the same time, construction of similar facilities in the International Rapids Section of the St. Lawrence River was undertaken by the Saint Lawrence Seaway Development Corporation of the United States. The Seaway was opened to commercial traffic on April 1, 1959 and officially inaugurated on June 26, 1959. With its opening, certain ancillary canals were transferred to the Seaway Authority's jurisdiction for operation and maintenance purposes. These include Lachine (closed in 1971), a section of the Cornwall Canal (closed in 1968), a portion of the third Welland Canal and the Canadian lock at Sault Ste. Marie. Tolls are not assessed against

vessel movements on these waterways and traffic data for them are not included in this Section. Major construction undertaken in 1967 on the channel to bypass the city of Welland is scheduled for completion by the navigation season of 1973.

Seaway traffic. Tables 15.23 and 15.24 give combined traffic statistics for the St. Lawrence and Welland Canals in 1970 and 1971. Duplicate transits are eliminated so that the figures show the actual total movement of goods through the St. Lawrence Seaway.

In 1971, 4,200 ships carrying about 28.2 million tons of cargo moved upbound through the Seaway and 4,228 vessels carrying 42.6 million tons moved downbound. Ocean-going ships carried 29.6% of the total cargoes and lakers 68.5%. Of the total tonnage carried upbound in 1971, 19.9 million tons were domestic cargo and 8.4 million tons were foreign traffic; downbound, 31.7 million tons were domestic freight and 10.9 million tons were carried to and from foreign ports.

On the Montreal - Lake Ontario section, upbound traffic amounted to 26.0 million tons in 1971 and downbound traffic to 26.9 million tons, an increase of 3.5% over 1970. Almost 51.6% of the former was accounted for by iron ore shipped from St. Lawrence ports to Hamilton and Lake Erie and the downbound traffic consisted largely of overseas shipments of wheat. There were 100 fewer upbound transits and 121 fewer downbound transits in 1971 than in 1970 indicating a slight decrease in the number of vessels using this portion of the Seaway. Bulk commodities comprised 83.8% of the total traffic through the section in 1971, the principal commodities through the St. Lawrence canals being iron ore, wheat, manufactured iron and steel, barley, corn, soybeans and fuel oil. Traffic patterns show that 34.3% of the total movement was between Canadian ports, 29.2% between Canadian and United States ports, and 36.4% consisted of foreign trade to and from Canada and the United States. The small remainder was traffic between ports in the United States.

There were 6,854 transits through the Welland Canal in 1971, with a cargo volume of 21.6 million tons upbound and 41.3 million tons downbound; bulk cargo accounted for 87.4% of the traffic. Although many vessels pass through both the St. Lawrence and Welland Canals on "through" trips, there is a substantial amount of local traffic between Great Lakes ports which involves only the Welland Canal. These movements are largely of iron ore, grain and coal. The Welland Canal traffic was 10.0 million tons greater than that reported for the Montreal - Lake Ontario section.

Income of the St. Lawrence Seaway Authority for 1971 amounted to \$27.8 million comprising toll revenue of \$24.4 million assessed for transits through the Seaway locks between Montreal and Lake Erie and sundry revenues (rentals, wharfage, bridge revenue, etc.) of \$3.4 million. Total expenses for 1971 amounted to \$21.9 million of which operation and maintenance expenses amounted to \$15.6 million, regional headquarters, headquarters administration and engineering expenses to \$5.7 million and construction to \$653,523 (Table 15.25).

15.4.4 Federal government marine services

Headquarters organization. The Marine Services of the Ministry of Transport has five branches - Operations, Marine Safety, Marine Pilotage, Marine Finance and Marine Personnel - each headed by a director responsible to the Deputy Administrator, Marine Services, Canadian Marine Transportation Administration. An additional unit, the Marine Emergency Office, also reports to the Deputy Administrator.

The Operations Branch has four divisions - Marine Aids, Canadian Coast Guard, Waterways Development and Telecommunications.

Marine Aids is responsible for planning, policy development and program administration related to a national system of marine aids to navigation and traffic control, and for research and development in these two areas. These responsibilities include the installation, operation and maintenance of electronic navigation systems such as Decca, Loran A and Loran C. They also include the development of port entry systems which involve radar surveillance, traffic control and conventional floating and shore-based aids to navigation. The Marine Aids Division develops standards and guidelines for the operation and maintenance of over 20,000 marine aids to navigation consisting of lightstations, buoys, fog signals and shore-based unattended lights. The Division carries out research and development related to new atomic and solar power sources as well as on conventional battery and hydro sources. The Marine Aids Division is responsible for administering the Navigable Waters Protection Act.

The Canadian Coast Guard Division is responsible for the over-all direction of the Canadian Coast Guard fleet which consists of more than 80 active ships including heavy, medium and light icebreakers, an icebreaker-cable repair ship and two weather-oceanographic ships which alternate in manning Pacific Weather Station "Papa", 900 miles west of Victoria, BC.

The fleet services thousands of lightstations, shore lights, buoys and other navigation aids along Canada's coasts and inland waterways. During the Ministry of Transport's Arctic re-supply operations each summer, Coast Guard ships work in conjunction with chartered commercial vessels to move approximately 500 tons of cargo to five or six northern ports. In the winter, the icebreakers aid commercial shipping in the Gulf of St. Lawrence from Cabot Strait to the Quebec north shore and break ice jams to prevent flooding along the St. Lawrence River, particularly between Trois-Rivières and Montreal.

In addition, Coast Guard ships patrol the St. Lawrence Ship Channel to ensure that it is maintained at its advertised depth; carry out most marine search and rescue operations; and assist other departments doing oceanographic and hydrographic research or investigating Arctic developments. Often a Coast Guard ship is the operational base for the scientific research team.

The Waterways Development Division is responsible for developing national plans, policy and programs to improve commercial navigable waterways and related research, including hydraulic model studies carried out in co-operation with other government agencies.

The Telecommunications Division is responsible for operating a communications and electronics engineering service in support of Marine Services ships and operations, for developing new or improved specialized equipment and for providing electronic navigational systems.

The Marine Safety Branch has three divisions – Steamship Inspection, Nautical Services and Air Cushion Vehicles. The Branch is responsible for administering the parts of the Canada Shipping Act related to operating Canadian ships and ships within Canadian waters; it is charged with the registering of shipping, licensing ships, certifying ships' officers and engaging and discharging ships' crews. Other responsibilities include safety inspection of ships, handling of dangerous cargoes, investigating marine accidents, and applying regulations regarding oil pollution in Canadian waterways.

The Marine Safety Branch protects the interests of the owners of wrecked ships and their cargo and the interests of the Crown in unclaimed wrecks. It has responsibilities for policy formulation in such matters as the coastal trade, the limitation of liability of ship, wharf and canal owners, and the rights and liabilities in disputes between ship owners and cargo owners, stevedores' liens, and salvage claims. The Branch also administers the Maritime Pollution Claims Fund which was established on February 15, 1972.

The Marine Pilotage Branch was established as a separate entity in February 1972 to provide advice on pilotage matters, and is responsible for establishing national technical standards and conducting research required to ensure that these standards are maintained. It is also responsible for prescribing standards for health, uniform financial reporting procedures, procedures for hearings held by Authorities, and recommending the establishment of compulsory pilotage areas where an Authority fails to do so and it is considered to be in the public interest.

The Pilotage Act, which came into force February 1, 1972, established four Regional Pilotage Authorities: Atlantic Pilotage Authority, Laurentian Pilotage Authority, Great Lakes Pilotage Authority, and Pacific Pilotage Authority. Their objectives are to establish, operate, maintain and administer, in the interest of safety, an efficient pilotage service within their respective regions.

The major function of the Marine Emergency Office is the development and execution of oil pollution contingency plans for all territorial waters including those which are contiguous with US waters.

Field organization. In the field, a regional management organization within the Marine Services is being developed to provide the Ministry with more efficient means of matching resources to workloads in all areas. Included in the completed system will be the 11 established district marine agencies, and some 15 other Marine Services field offices that in the past have been reporting individually to Marine Services directors or to the Administrator, Canadian Marine Transportation Administration.

The first step was completed in 1967 with the establishment of the Maritime Region, covering the Maritime Provinces and outlying islands including Sable Island and the Magdalen Islands, and including all marine works, marine operations and marine regulations activities in the three provinces. In 1968, the Western Region, including the Pacific Coast, western and northwestern Canadian waterways and the western Arctic, was established with the same responsibilities as the Maritime Region. Later, Newfoundland (and Labrador) was reorganized using an area concept and reporting through an area manager located at St. John's. The Laurentian Region was established early in 1972 and covers all Marine Services field responsibilities in Quebec. The Central Region was established in the summer of 1972 covering Ontario and Manitoba.

Aids to navigation. Canada's system of aids to navigation is compatible with other North American systems and is installed, operated and maintained as a support service for the safe and expeditious passage of marine commerce and the boating public. The Ministry of Transport maintains lights, buoys, day beacons, radio beacons and two electronic networks operating on the hyperbolic principle — Loran and Decca — in Canadian and contiguous waters. During the year ended March 31, 1971, 4,024 lights, 381 fog signals, 2,436 lighted buoys and 13,317 unlighted buoys and beacons were maintained.

All aids incorporating light or sound devices are listed in the Ministry of Transport annual publication, *List of lights, buoys and fog signals*. Information on radio beacons and on Loran and Decca is published in *Radio aids to marine navigation*. Broadcast *Notices to shipping* and weekly editions of *Notices to mariners* provide additional information on marine hazards and related matters.

Steamship inspection. The Board of Steamship Inspection, established under the Canada Shipping Act, formulates and enforces a variety of regulations made under the Act, the most important of which deal with: approval of design and construction of ships and equipment; inspection during construction and periodically afterward; the carriage of dangerous goods; accident prevention during cargo operations; pollution prevention and control of the marine environment; and training and certification of marine engineers.

The Board's headquarters is in Ottawa; field offices are maintained in the principal ocean and inland ports. Some 2,000 Canadian-owned or registered ships were inspected during the fiscal year ending March 31, 1972.

15.5 Civil aviation

15.5.1 Administration and policy

Administration. Civil aviation in Canada is under the jurisdiction of the federal government and is administered under the authority of the Aeronautics Act and the National Transportation Act as amended. The Aeronautics Act is in three parts. Part I deals with the technical side of civil aviation including matters of aircraft registration, licensing of airmen, establishing and maintaining airports and facilities for air navigation, air traffic control, accident investigation and the safe operation of aircraft. This Part of the Act is administered by the Director General, Civil Aeronautics, under the supervision of the Administrator, Canadian Air Transportation Administration, Ministry of Transport. Part II of the Act deals with the economic aspects of commercial air services and assigns to the Canadian Transport Commission certain regulatory functions respecting commercial air services. Part III deals with matters of internal administration in connection with the Act.

International air agreements. Canada's position in the field of aviation as well as its geographical location makes imperative its co-operation with other nations engaged in international civil aviation. Canada therefore took a major part in the original discussions that led to the establishment of the International Civil Aviation Organization which has headquarters in Montreal, Que. In 1972, Canada had air agreements with 23 other countries.

Federal civil aviation policy. The federal government's objective is to provide an efficient and stable service for the Canadian public within the best possible economic framework for the development of commercial aviation. In formulating its aviation policy in 1964, three basic principles were accepted by the government. The first related to the international field and stated that air services provided by Canadian airlines should serve the Canadian interest as a whole; that these services should not be competitive or conflicting but should represent a

single integrated plan which could be achieved by amalgamation, by partnership or by a clear division of fields of operations. In a further policy statement in June 1965, the Minister of Transport defined more precisely the respective areas of operation of Air Canada and Canadian Pacific Air Lines Limited (CP Air); additional international air services have since been introduced consistent with government policy.

The second principle stated that, although competition was not to be rejected, development of competition should not compromise or seriously injure the economic viability of Air Canada's domestic operations, and if competition continues, opportunity should be ensured for growth to both lines above this basic minimum. In accordance with this principle, the government authorized the Canadian Transport Commission (CTC) to permit CP Air to operate additional transcontinental air services, and to serve Calgary, Edmonton and Ottawa in addition to Vancouver, Winnipeg, Toronto and Montreal.

The third principle concerned the role of regional air carriers providing scheduled service and their relationship with the mainline carriers. Recommendations were prepared by the two major airlines and the larger regional carriers which resulted in a "Statement of principles for regional air carriers" tabled by the Minister of Transport in the House of Commons on October 20, 1966. These principles are summarized as follows: (1) Regional carriers will provide regular route operations into the North and will operate local or regional routes to supplement the domestic mainline operations of Air Canada and CP Air; they will be limited to a regional role. (2) Greater scope will be allowed regional carriers in developing routes and services by the following means: where appropriate, limited competition on mainline route segments of Air Canada or CP Air may be permitted to regional carriers if this is consistent with their local route development; in a few cases, secondary routes at present operated by Air Canada and CP Air may become eligible for transfer to regional carriers; and a larger role will be allotted to regional carriers in connection with the development of domestic and international charter services, inclusive tours and new types of services. (3) Greater co-operation between the mainline carriers and the regional carriers will be developed in a variety of fields, ranging from technical and servicing arrangements to joint-fare arrangements. (4) A limited policy of temporary subsidies for regional routes will be introduced, to be based on a "use it or lose it" formula. (5) Firmer control will be exercised over the financial structure of regional carriers in connection with new licensing arrangements. (6) Regional carriers will be assisted in acquiring aircraft by developing a scheme for consultation between government and the carriers regarding plans for new aircraft, and by a special investigation designed to explore the possibility of developing a joint approach to this problem on the part of the carriers.

In a statement made on August 15, 1969, the Minister of Transport defined more precisely the regions in which each of the five regional carriers would be permitted to supplement, or authorized to replace, mainline operations as circumstances warranted; and authorized the CTC to consult with the mainline carriers and appropriate regional carriers and give urgent consideration to the application of the regional policy. During 1969, the CTC's Air Transport Committee issued a number of decisions authorizing new services by regional air carriers in accordance with the Regional Air Policy, and the Committee is continuing to apply this policy.

Air traffic control. The primary functions of air traffic control in the Ministry of Transport are to prevent collisions between aircraft operating within controlled airspace and between aircraft and obstructions on the manoeuvring area of controlled airports, and to expedite and maintain a safe, orderly flow of air traffic. These functions are carried out by air traffic controllers situated in airport control towers, terminal control units and area control centres.

Airport control service is provided to aircraft operating on the manoeuvring area or in the close vicinity (five to ten nautical-mile radius) of civil airports where the volume and complexity of air traffic indicate its need in the interest of flight safety. Service is also provided to other traffic, such as vehicles and maintenance equipment, on the manoeuvring area of an airport. Radio is the prime means of communication, although light signals may be used where radio is not available. Airport control towers are in operation at: Gander International, St. John's, and Wabush (Labrador), Nfld.; Halifax International and Sydney, NS; Fredericton, Moncton and Saint John, NB; Baie Comeau, Cartierville, Montreal International, Quebec, St. Honoré, St. Hubert, St. Jean and Sept Îles, Que.; Buttonville, Hamilton, London, North Bay, Oshawa, Ottawa International, Sault Ste. Marie, St. Catharines, Sudbury, Thunder Bay, Toronto International, Toronto Island, Waterloo - Wellington and Windsor, Ont.; Brandon,

St. Andrews, Thompson and Winnipeg International, Man.; Regina and Saskatoon, Sask.; Calgary International, Edmonton International, Edmonton Industrial, Grande Prairie, Lethbridge and Springbank, Alta.; Abbotsford, Fort St. John, Kamloops, Kelowna, Langley, Penticton, Pitt Meadows, Port Hardy, Prince George, Vancouver International and Victoria International, BC; Whitehorse, YT; and Yellowknife, NWT.

Terminal control service is provided to aircraft which are "climbing out" after departure from or "letting down" for a landing at an airport. It is a service provided to such flights operating in accordance with the instrument flight rules in order to separate them from one another and from en route aircraft operating through the terminal area which normally is an airspace within 30-50 nautical miles of an airport and which, in some cases, may encompass more than one airport. Radar is normally used, in conjunction with direct controller-pilot radio communication. Procedural means are used at some remote locations where radar is not yet available. The service is provided from all area control centres but separate terminal control units are installed at high traffic density airports where no area control centre is located. Such separate units have been established at Halifax, Quebec City, North Bay, Ottawa, Thunder Bay, Regina, Saskatoon, and Calgary.

Area control service is essentially an aircraft separation and flight-following service provided to aircraft operating en route between airports. All flights that elect to file flight plans are given flight-following service, and separation is provided to all aircraft operating according to the rules for instrument flight or controlled visual flight within designated controlled airspace, i.e., all airways below 23,000 ft above sea level (asl) and all airspace in Canada south of 70° North latitude above 23,000 ft asl. In addition, the service is provided north of 70°N to all aircraft operating above 29,000 ft asl, and to aircraft operating above 5,000 ft over almost all of the western half of the North Atlantic Ocean. Separation is provided using both radar and procedural means, with direct and indirect communication between controller and pilot. An extensive land line communication system links an area control centre with all affiliated airport control towers, terminal control units and communication stations and with adjacent area control centres in Canada and adjoining states, as well as with other agencies providing supporting and auxiliary services or having a need to deal directly with the centre, such as air carrier operation agencies and military operation agencies. Area control centres provide additional services. The Aircraft Movement Information Service assists the Department of National Defence in identifying all aircraft operating in specified areas. The Customs Notification Service facilitates the notification of appropriate customs agencies by pilots planning to cross the Canada - United States border. When necessary, appropriate search and rescue organizations are notified by the Alerting Service. Pilots planning flights receive information such as weather and field reports from the Flight Information Service. Area control centres are located at Gander, Nfld.; Moncton, NB; Montreal, Que.; Toronto, Ont.; Winnipeg, Man.; Edmonton, Alta.; and Vancouver, BC.

Airspace Reservation Service provides reserved airspace for specified operations within controlled airspace and information to other pilots concerning these reservations and military activity areas in controlled and uncontrolled airspace. The Airspace Reservation Coordination Office, located in Ottawa, is responsible for providing the service in all Canadian airspace of Canada and in the Gander Oceanic Control Area.

15.5.2 Commercial air services

The Canadian flag carriers operating international and domestic air routes are Air Canada and CP Air, which together earn 75% of the total operating revenues of Canadian commercial air carriers. The five regional carriers (Eastern Provincial Airways, Nordair, Quebecair, Pacific Western Airlines and Transair) earn 12% of the total operating revenues. The remaining 13% is earned by some 500 smaller airlines, many of them operating in areas of Canada which are relatively inaccessible by surface transport. On international routes, the Canadian flag carriers provide scheduled services to Europe, the Soviet Union, Asia Minor, Japan and Hong Kong, Mexico and South America, the Caribbean, Australia and the United States (including Hawaii). Thirty-one foreign airlines have scheduled services between Canada and other countries.

The Canadian Transport Commission (Air Transport Committee) in its Directory of Canadian Commercial Air Services classifies commercial air carriers into two major groups, domestic and international.

Domestic air carriers, which operate wholly within Canada, are divided into seven classes:

(1) Scheduled carriers provide public transportation of persons, goods or mail to designated points according to a service schedule, at a toll per unit; (2) Regular Specific Point carriers, to the extent that facilities are available, provide public transportation of persons, etc., to points according to a service pattern, at a toll per unit; (3) Specific Point carriers provide public transportation, serving points consistent with traffic requirements and operating conditions, at a toll per unit; (4) Charter carriers offer public transportation from a base specified in the licence, at a toll per mile or per hour for the charter of the entire aircraft, or at such other tolls as may be permitted by the Air Transport Committee; (5) Contract carriers do not offer public transportation, but carry persons or goods solely under contract; (6) Flying clubs are incorporated as non-profit organizations and provide flying training and recreational flying; (7) Specialty carriers operate for purposes not provided by other classes such as aerial photography and survey, aerial distribution (crop dusting, seeding), aerial inspection, reconnaissance and advertising, aerial control (fire control, firefighting, fog dispersal), aerial construction, and air ambulance and mercy services.

International air carriers, which operate between points in Canada and points in any other country, constitute two more classes of carrier: (8) International Scheduled carriers provide public transportation, serving points according to a service schedule, at a toll per unit; and (9) International carriers are domestic and foreign air carriers which operate any commercial service performed by domestic carriers in (2), (3), (4) and (5).

15.5.2.1 Canada's international flag carriers

Air Canada, a Crown corporation incorporated in 1937 as Trans-Canada Air Lines, maintains passenger, mail and commodity services over a network of 89,000 route-miles, extending to 57 destinations in Canada, the United States, the British Isles, Europe and the Caribbean. Affected by recessionary pressures in both North America and Europe, the company's growth was slow in 1971, but economic improvement helped stimulate records in 1972. In 1971, Air Canada carried 7.4 million revenue passengers, virtually unchanged from 1970; in 1972, this figure increased to 8.3 million. A small net income of \$1.7 million was recorded in 1971, compared with a \$1 million loss the year before. Results were expected to be sharply improved in 1972.

The record revenue and traffic performances achieved in 1972 were adversely affected during January and February by strikes that disrupted air traffic control services, and by a one-day walkout of pilots in June to protest hijackings. However, single-day, one-month, and one-year records were established for passenger volumes.

Available seat-miles on scheduled flights increased in 1972 to 12,169 million compared with 11,706 million in 1971. Revenue passenger-miles grew by 23.0% to 7,901 million, a reflection of growth in the long-haul North Atlantic market. Passenger load factor across the system was 64.9%, up from 55.0% in 1971. Total revenue ton-miles increased almost 20.0% to 1,060 million. Air freight continued to show satisfactory growth, expanding by 11.0% in 1972 to 223 million ton-miles. Air mail totalled 35.8 million ton-miles, an 8.0% increase over 1971, and air express grew by 10.8% to 9.8 million ton-miles.

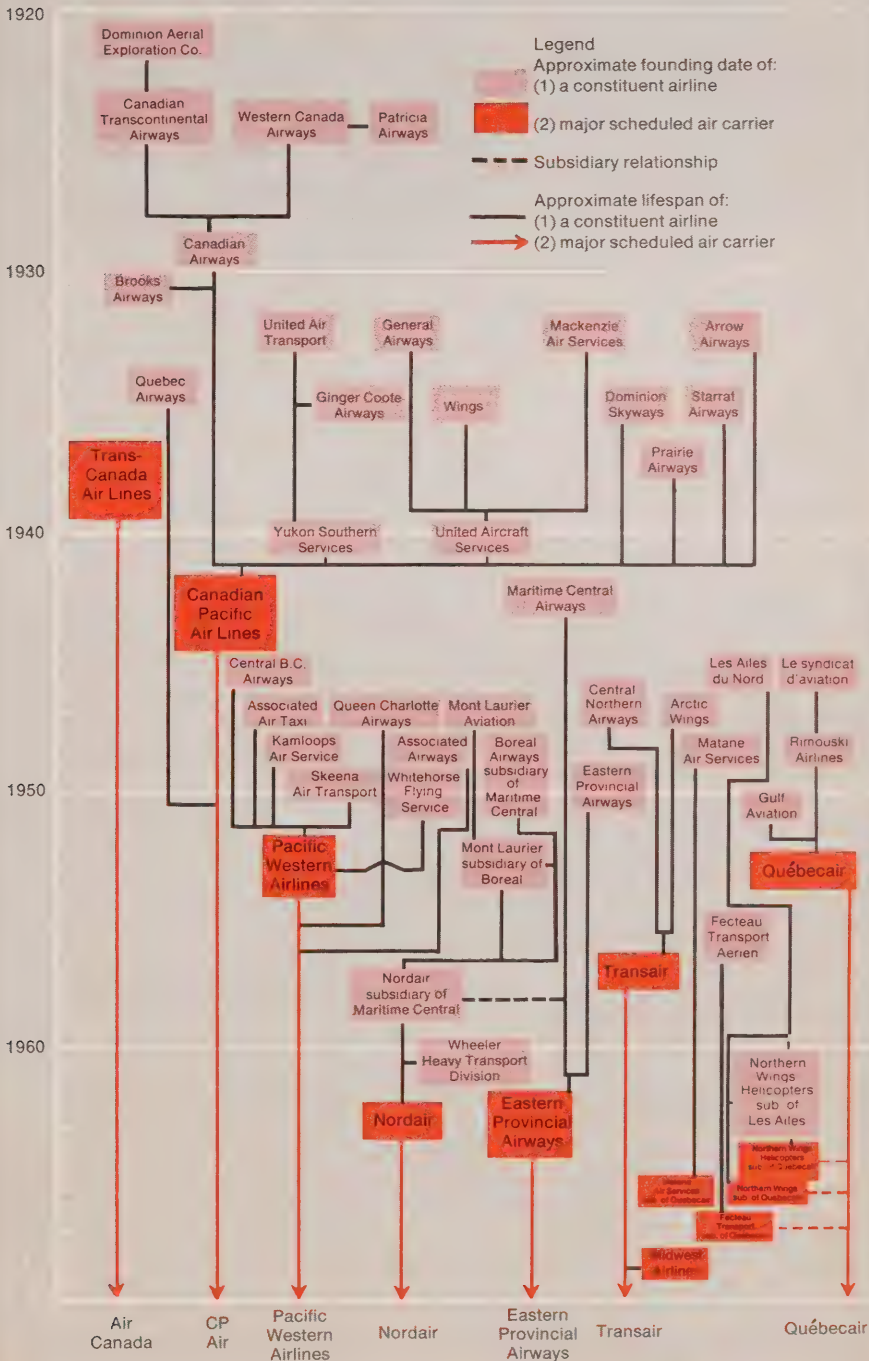

Passenger revenues, which account for 80% of total revenues, amounted to \$410 million in 1971, up from \$387 million in 1970. Total revenues were \$508 million, compared with \$478 million in 1970. Operating expenses in 1971 climbed to \$480 million, compared with \$457 million the previous year.

During the period, Air Canada took delivery of three Boeing 747s and 11 DC-9s, while retiring all Vickers Vanguards and most Vickers Viscounts. At the end of 1972, the operating fleet consisted of 103 aircraft: three Boeing 747s, 38 DC-8s, 47 DC-9s and 15 Viscounts; jets accounted for 98% of all seat-miles provided compared with 90% in 1970. The company will take delivery of five 257-seat Lockheed L-1011 aircraft during 1973 and another five in 1974.

Canadian Pacific Air Lines Limited (CP Air), a private airline, was established in 1942 by integrating ten bushline air carrier companies and has since developed into a major national flag carrier. In 1971, CP Air carried 1.5 million revenue passengers, 2,410.1 million passenger-miles. Operating revenues for the year reached \$154.9 million.

CP Air's network radiates from the company's headquarters at Vancouver to Japan, Hong Kong, the Netherlands, Honolulu, Fiji, Australia, Portugal, Spain, Italy, Greece, Israel, Mexico, Peru, Chile and Argentina. There are regular west coast flights between San Francisco and Vancouver. The airline's operations in the Far East are extremely important to Canada's

Genealogy of the major
scheduled air carriers to 1970

relations with the developing nations in that area. Within Canada, CP Air's transcontinental services link Vancouver, Edmonton, Calgary, Winnipeg, Toronto, Ottawa and Montreal, and the company also operates interior services in British Columbia and the Yukon Territory.

CP Air operates 22 aircraft: seven Boeing 737s, four Boeing 727s and 11 DC-8s. The airline has ordered two Boeing 747 wide-bodied jet aircraft for delivery at the end of 1973.

15.5.2.2 Regional airlines

Eastern Provincial Airways (1963) Limited is the regional carrier for the Atlantic Provinces. In 1972 it carried 377,334 revenue passengers 160.0 million passenger-miles, and 5,248 tons of freight 2.5 million ton-miles. Operating revenues were \$18.5 million, 14% higher than 1971 revenues of \$16.2 million. Scheduled services were operated to Charlottetown, PEI; Moncton - Chatham - Charlo - Fredericton and Saint John, NB; Sydney and Halifax, NS; Deer Lake (Corner Brook) - Gander - St. John's and St. Anthony, Nfld.; Goose Bay - Wabush (Labrador City) and Churchill Falls in Labrador; and Montreal - Sept Îles and the Magdalen Islands in Quebec. The company's fleet at the end of 1972 consisted of three Boeing 737s, three Handley Page Dart Herald, one Carvair and one DC-3.

Nordair Ltée-Ltd., head office Dorval, Que., was established in 1957 by the merger of Mont Laurier Aviation and Boreal Airways. Since its formation, Nordair has expanded steadily and operates scheduled services in Quebec, Ontario and the Northwest Territories, as well as extensive domestic and international charter flights throughout Canada and from eastern Canada to the southern United States and Caribbean islands.

Scheduled services are operated between Montreal, Ottawa, Hamilton, Windsor and Pittsburg and between Montreal, Val d'Or, Fort George, Great Whale and Fort Chimo, Que. and Frobisher Bay and Resolute Bay, NWT. Nordair also maintains an extensive air service based at Frobisher Bay, NWT, supplying numerous Arctic settlements in the Baffin Island area, such as Clyde River-Cape Christian, Broughton Island, Pangnirtung, Cape Dorset, Hall Beach and Igloolik. Applications are before the Air Transport Committee to extend Nordair's services to Yellowknife, NWT, to several points in the general area of the James Bay hydro-electric development project, and before the Danish Civil Aviation authorities to inaugurate regular air service between Frobisher Bay and Sondrestrom-Fjord in Greenland. This latter application already has the approval of the Canadian government.

Nordair's charter flights accommodate inclusive tour travels and group travel. Its northern charter operations are based at Fort Chimo and Frobisher Bay from which points a variety of aircraft, including wheel-, ski- and float-equipped aircraft, are available.

Nordair's fleet is composed of four Boeing 737-200Cs, three Lockheed L-188 turbo-props, five DC-3s, two C-46s, one DC-4, three F-227s, one Twin Otter, one Short Skyvan, one Beaver and one Mallard amphibious aircraft.

Pacific Western Airlines Ltd., with head office at Vancouver International Airport, operates over more than 12,000 route-miles; its services include scheduled mainline local regular unit toll and charter flights in British Columbia, Alberta, Saskatchewan and the Northwest Territories.

Regularly scheduled mainline services are operated north-bound from Edmonton to Prince George, Dawson Creek, BC; Peace River, Fort McMurray, Rainbow Lake, Fort Chipewyan, Alta.; Uranium City, Sask.; Fort Resolution, Hay River, Fort Smith, Fort Simpson, Wrigley, Norman Wells, Inuvik, Yellowknife, Cambridge Bay and Resolute, NWT. The only no-reservations-required AirBus service in Canada operates daily between Calgary and Edmonton, Alta. On the Pacific Coast, mainline services are operated from Vancouver to Comox, Powell River, Campbell River and Port Hardy, Sandspit and Prince Rupert. In the interior region of British Columbia, Pacific Western operates scheduled services from Vancouver to Kelowna, Penticton, Cranbrook, Kamloops and through to Calgary, Alta.; and also Vancouver to Grand Forks, Castlegar, Calgary; and Vancouver, Williams Lake, Quesnel. The company also operates international charter passenger services. Large aircraft charters are operated from the major centres of Vancouver, Edmonton and Calgary. Pacific Western operates extensive freight services, both scheduled and chartered, into the Northwest Territories. Three Lockheed Hercules and a Boeing 320C provide international charter freight services.

In 1971, 1.1 million revenue passengers were carried, revenue passenger-miles totalled 501.1 million, cargo ton-miles were 29.7 million and aircraft miles flown numbered 11.4

million. Comparable figures for 1970 were 887,634, 530.5 million, 26.6 million and 11.5 million, respectively.

Pacific Western Airlines operates 20 aircraft: one Boeing 727, two Boeing 707s, five Boeing 737s, five Convair 640 jet-props, three Lockheed Hercules (freight), two Mallards and two Lockheed Electras (passenger and freight).

Quebecair, with its head office at Montreal, offers scheduled services in Quebec and Labrador. The company was founded in 1946 under the name *Le Syndicat d'Aviation de Rimouski*. The name was changed to Rimouski Airlines in 1947 and to *Quebecair* in 1953 when it was amalgamated with Gulf Aviation. During 1965, Quebecair acquired Northern Wings Limited and Northern Wings Helicopters Limited and in 1967, A. Fecteau Transport Aérien Ltée.

Quebecair is responsible for operating scheduled services and the subsidiaries handle flights by light aircraft, charter and contract services. Scheduled services are operated over 6,000 miles serving some 43 localities in nine economic regions of Quebec and Labrador. Points linked are Montreal, Quebec City, Murray Bay (Charlevoix), Baie Comeau (Hauterive), Churchill Falls (Twin Falls), Gagnon, Wabush (Labrador City), Mingan, Mont Joli-Rimouski, Rivière au Tonnerre, Saguenay (Bagotville), Schefferville, Sept Îles, Senneterre, Mistassini, Temiscaming, Lac Doda, Lac Caché, Lac Mistassini, Rupert River, Fort George, Obedjiwan, Oskelaneo, Manouane, Val d'Or, Amos, Lebel-sur-Quévillon, Rupert House, Chibougamau, Matagami, Blanc Sablon, Saint Paul, Old Fort Bay, St. Augustin, La Tabatière, Tête à la Baleine, Harrington Harbour, Gethsemani, Kégaska, Natashquan, Aguanish, Baie Johan Beetz and Havre St. Pierre. Quebecair also operates group charters within Canada and to the United States, the Caribbean, Bermuda, Mexico and South America, using jet aircraft.

Revenue passengers transported by Quebecair in 1972 numbered 400,845 for 151.0 million passenger-miles, and 3,870 tons of goods were hauled for a total revenue of \$11.3 million.

The combined fleet of Quebecair and its subsidiaries totalled 67 units: three BAC-1-11s, four F-27s, seven DC-3s, one C-46, nine DHC-3 Otters, 11 DHC-2 Beavers, 11 Cessna 180s and 185s, two Dornier 28s, one Beechcraft Queen Air and 18 helicopters.

Transair Limited. This company was formed in November 1969 through the merger of Transair Limited and Midwest Airlines Ltd., both of Winnipeg. With headquarters at the Winnipeg International Airport, the company operates scheduled services in Manitoba, Saskatchewan, Ontario and the Northwest Territories and charter flights throughout Canada and from Canada to the United States, Mexico and the Caribbean. The company's scheduled services are operated in Manitoba — from Winnipeg to The Pas - Flin Flon - Lynn Lake - Thompson and return; from Winnipeg to Gillam - Churchill and return; from Winnipeg to Thompson - Churchill and return; from Winnipeg to Norway House and return; from Winnipeg to Brandon and return; from Winnipeg to Dauphin - Yorkton and return; Eastern — from Winnipeg to Thunder Bay - Toronto and return; from Winnipeg to Kenora - Dryden - Thunder Bay - Sault Ste. Marie - Toronto and return; from Winnipeg to Red Lake and return; and Arctic — from Churchill to Eskimo Point - Rankin Inlet - Baker Lake and return; from Churchill to Coral Harbour - Repulse Bay - Hall Beach and return. Several other points in the Northwest Territories are also served by flights from Churchill.

Transair's fleet comprises 27 aircraft, including 14 helicopters, and ranges from small, single-engined aircraft equipped with wheels, skis or floats for access to remote hinterland and short-airstrip areas, to multi-engine aircraft, including two Boeing 737 twin jets, one Fokker F-28 jet, three Argosy 222 freighters capable of carrying 28,500 lb., three DC-3s, two YS-11s, one HS-748 and one DC-4. Most of the fleet is stationed at Winnipeg but several turbo-prop and piston aircraft are usually positioned at the company's major base at Churchill, Man., in support of its Arctic and DEW-line operations. Since 1961, under contract with the United States Air Force, Transair has operated, from Winnipeg and Churchill, the vertical re-supply flights to the four main sites in the Canadian sector of the DEW-line in the extreme Arctic.

During 1972 services were increased or upgraded to provide more winter charter flights to the Bahamas and Jamaica, two scheduled Boeing 737 flights daily, in and out of Toronto, extended commuter service for Fort Francis - Dryden, and Dryden - Pickle Lake - Sioux Lookout; and expanded Argosy operations in the Arctic. In 1972 Transair contracted with Norcanair to provide high frequency air taxi service between Regina, Saskatoon and Prince

Albert, replacing Transair's turbo-prop service; and Transair introduced turbo-prop service from Kenora, Red Lake and Dryden into Winnipeg.

In 1972 the company flew 5.4 million miles and carried 327,707 passengers 159.0 million passenger-miles, compared with 337,116 passengers for 145.0 million passenger-miles in 1971. Operating revenues equalled \$16.8 million in 1972 and \$15.9 million in 1971.

15.5.2.3 Commonwealth and foreign scheduled commercial air services

At the end of 1972 there were 32 foreign air carriers holding valid Canadian operating certificates and licences issued for international scheduled commercial air services into Canada: Aeroflot (USSR), Aeronaves de Mexico, S.A., Air France, Air Jamaica (1968) Ltd., Alaska Airlines, Inc., Alitalia-Linee Aeree Italiane, Allegheny Airlines Inc., American Airlines Inc., British Overseas Airways Corporation, British West Indian Airways, Czechoslovak Airlines, Delta Airlines Inc., Eastern Air Lines, El Al Israel Airlines Ltd., Hughes Air West, a division of Hughes Air Corporation, Iberia Air Lines of Spain, Irish International Airlines, Japan Air Lines Company Ltd., KLM Royal Dutch Airlines, Lufthansa German Airlines, North Central Airlines Inc., Olympic Airways S.A., Qantas Airways Limited, Sabena Belgian World Airlines, Scandinavian Airlines System, Seaboard World Airlines Inc., Swissair, Transporter Aeroes Portugueses, S.A.R.L., United Air Lines Inc., Western Air Lines Inc. and Wien Consolidated Airlines Inc.

15.5.3 Civil aviation statistics

Ground facilities. Canadian aerodromes are listed in Table 15.26, classified by regions as licensed or unlicensed land facilities or seaplane bases, or military aerodromes. Licensed aerodromes are those that are inspected by Ministry of Transport inspectors at regular intervals and meet specific standards. In addition to aerodromes, a network of radio aids to navigation is maintained to facilitate en route navigation and safe landings under instrument conditions.

Airport activity. In 1971, 6.3 million aircraft movements were recorded at 174 reporting airports, 1.2 million at airports without towers, and 5.1 million at 58 airports with air traffic control towers. Of the latter, the 53 airports with Ministry of Transport towers registered 4.9 million aircraft movements (Table 15.27), the five Department of National Defence airports, 161,183 movements.

In 1971, for the fourth consecutive year, Toronto International airport led in itinerant activity with 165,426 movements; Montreal International retained second place with 148,027; Vancouver International was third with 142,120 and Winnipeg and Ottawa International airports occupied fourth and fifth positions with 114,161 and 93,194 movements, respectively.

At airports with air traffic control towers, aircraft weighing less than 4,000 lb. accounted for 48% of the itinerant movements in 1971, those weighing over 39,000 lb. for 30%. Movements by aircraft of more than 314,000 lb., including the Boeing 747, the DC-8 30-to-60 series, the Ilyushin 62 and the Super VC-10, increased to 53,657 movements or 20% more than in 1970.

There were 205,179 international movements in 1971 (89 fewer than in 1970). Toronto and Montreal International airports reported 57.2% of this total. Toronto handled 65,481, of which 56,506 were "transborder" (to and from the United States) and 8,975 were "other international" (to and from points outside Canada and the United States); Montreal International reported 51,899 international movements of which 35,673 were transborder, 16,226 other international.

According to the 1971 survey, 116 airports without towers handled 1.2 million movements, 13.5% fewer than the 1.4 million total reported by the 113 airports in the 1970 survey. Itinerant movements totalled 421,068, up 0.7% over the 418,236 in 1970; local movements, primarily training flights, numbered 786,375, 19.6% fewer than the 978,961 movements in the previous year.

Commercial air services. Table 15.28 provides statistics on commercial air services conducted in Canada by Canadian, American and other foreign airlines with gross annual flying revenues exceeding \$100,000 in 1967-68 and \$150,000 in 1969-71. Canadian airline figures refer to domestic and international operations; foreign airline figures, to the miles and hours flown over Canadian territory only, excluding passengers and goods in transit through Canada. Table 15.29 gives comparative figures for domestic and international traffic in 1971.

Personnel licences. At March 31, 1972, the total number of personnel licences in force in

Canada was 40,932, compared with 39,479 on the same date in 1971. The 1972 licences were constituted as follows, with comparable 1971 figures in brackets: glider pilots, 908(1,529); private pilots, 26,121(25,237); commercial pilots, 5,139(4,730); senior commercial pilots, 797(744); airline transport pilots, 2,851(2,792); flight navigators, 196(211); air traffic controllers, 1,430(1,025); flight engineers, 107(93); aircraft maintenance engineers, 3,378(3,113); and gyrocopter pilots, 5(5).

15.6 Urban transit

The processes of urbanization and suburbanization continue to concentrate the nation's population in a small number of urban centres. Some three quarters of Canada's population now live in urban areas with about one half in the 20 largest cities and their suburbs. Approximately 50% of all transport activity occurs in urban areas.

The task of reporting transportation statistics for urban and rural areas separately is a difficult one as many transport trips occur between urban and rural points. Also, definitions of the dividing line between urban and rural ones must be arbitrary as they depend on population densities which change with the process of urbanization. It has been easier to maintain transportation statistics by the principal modes — rail, road, water, air — without the added complexity of an urban vs. rural factor.

The demand for adequate transport facilities in urban areas has placed a heavy financial burden on municipalities. Provincial cost-sharing programs which have contributed to the capital and operating costs of transportation systems in urban areas have until recently been strongly oriented to freeways and roads. The federal government also has a large involvement in transport in urban areas through major transport facilities such as ports, airports and rail facilities and services. About 60% of all federal expenditures on transportation are made in urban areas.

Public attitudes toward transport are changing. Attempts to expand road systems have led to adverse public reaction in some cities. Public concern to withhold land from expressway use and to protect the environment is reflected in growing interest in public transit. Some provincial governments have reacted to this situation and taken steps to meet public concern by shifting emphasis away from highway programs and increasing their commitments to public transport systems. In co-operation with the provinces, the federal government has begun a review of its transport policies as they affect urban areas. Changes may be approved relating particularly to federal activities in urban areas connected with port, airport and rail facilities and services.

With growing public interest and increasing involvement by all levels of government, it can be expected that more specialized statistical data will be developed to monitor the complex subject of transport in urban areas.

Coal	11,410	12,600			
Crude oil and bituminous substances	259	205	Total	233,898 ²	236,410

¹ In this table duplications are eliminated, i.e., freight that is interlined between two or more Canadian railways is counted only once. The statistics do not cover United States operations of Canadian railways except for the Canadian Pacific Railway line through Maine, US, and certain other short mileages which are deemed to be an integral part of the Canadian railway system. Sections of United States railways operating into Canada are regarded as Canadian railways and are included. Freight carried by the Cartier Railway is included in this table; however, financial data for this railway are not available for inclusion in the financial tables.

² Excludes traffic moved in railway-operated containers and trailers.

³ Includes express-rated traffic.

15.5 Capital invested in railway road and equipment property, 1967-71 (thousand dollars)

Investment	1967	1968	1969	1970	1971

Chapter 16

Communications

16.1 Telecommunications

The size, topography and climate of Canada have significantly influenced the development of telecommunications in this country. Vast networks of telephone, telegraph, radio and television facilities are necessary to provide efficient communications between individual Canadians and the rest of the world. As a result Canada possesses a somewhat unique structure whereby telephone and telegraph companies and a domestic satellite facility co-operate closely to carry messages to all parts of the country by microwave, tropospheric scatterwave systems, satellite, land lines and high frequency radio bands.

The Canadian Telecommunications Carriers Association (CTCA), established in February 1972, provides the framework for co-operation on an industry-wide basis for the major telecommunications carriers in Canada. The Association consists of 23 telecommunications carriers organizations, each represented on the board of directors by a senior officer. It brings together in one organization the Trans-Canada Telephone System and its eight members, The Canadian Independent Telephone Association, nine other telephone companies, and Canadian National and Canadian Pacific Telecommunications, Canadian Overseas Telecommunication Corporation, and Telesat Canada. CTCA has its headquarters in Ottawa.

The vital importance of telecommunications in Canada was recognized in the creation of the federal Department of Communications in 1969. The new Department concerned itself with a comprehensive inquiry into all aspects of Canada's information system. This "Telecommission" study, completed in the spring of 1971, provided the guidance for the formulation of national communications policies and programs. Supplementing this study is a report recently completed by the Canadian Computer/Communications Task Force charged with making recommendations to the government to assist in formulating legislation concerning the Canadian computer/communications industry. The report has now been submitted. The combination of computer technology and the technology of telecommunications was the latest stage in permitting a national linking of computers. Since then, the concept of multi-user sharing of a central data processing complex has rapidly gained acceptance. The Department has also sponsored projects to help high schools and universities use the latest communications and computer systems for exploring computer-assisted learning. One such project is CANUNET, a study being conducted by Canadian universities to see if it is possible to design a computer/communications network to serve the collective needs of universities.

16.1.1 Telecommunications media

16.1.1.1 Voice communications

Telephone service. Canadians are among the most avid telephone talkers in the world. Almost 11 million telephones are in service, or one for nearly every two Canadians, about ten million of them serviced by the eight member companies of the Trans-Canada Telephone System. Constituent members of the system are: Newfoundland Telephone Company Limited; Maritime Telegraph & Telephone Company Ltd.; The New Brunswick Telephone Company Limited; Bell Canada; Manitoba Telephone System; Saskatchewan Telecommunications; Alberta Government Telephones; and British Columbia Telephone Company.

Another three quarters of a million telephones are provided by Edmonton Telephones; Island Telephone Co. Ltd.; Northern Telephone Ltd.; Okanagan Telephone Co.; Ontario Northland Communications; Québec Téléphone; Télébec Ltée; Téléphone du Nord de Québec Inc.; Thunder Bay Telephone Department; and Canadian National Telecommunications. In addition, some 1,200 smaller telephone companies provide telephone services.

Canadian National Telecommunications, geographically the largest single system in Canada, provides telephone service for residents in the Yukon Territory and Northwest Territories, parts of Newfoundland and in northern sections of British Columbia; in all, it has some 44,000 subscribers.

Each member company of the Trans-Canada Telephone System (TCTS) fulfils a dual role: first, to provide good quality service within its own territory and second, to integrate its

facilities with those of the other members and with those of all the other telephone companies in Canada to provide connections with telephones elsewhere in North America and overseas. Collectively, the system operates the world's longest single microwave network, carrying telephone conversations, radio and television programs, and data coast-to-coast.

About 85% of the telephones in Canada have access to direct dial long distance equipment that automatically routes calls and bills the customer. Continuing automation of facilities made possible a reduction in rates on customer-dialled calls of over 400 miles within the network. At the same time, TCTS replaced the three-minute minimum calling charge with a one-minute minimum for direct dial calls.

TCTS companies have invested \$7,500 million in their facilities and during 1973 expect to spend an additional \$1,000 million. Gross revenues for 1972 were about \$1,700 million.

In 1972, TCTS members continued their program of installing electronic switching systems in several Canadian centres. With computers controlling their operation, electronic switching systems can be expanded by enlarging the computer programs. The computer also makes it possible for one telephone to do the work of many more complex pieces of equipment.

Other services have been developed to meet specialized needs for voice-only communications. These range from aids to the handicapped to services such as wide area telephone service and Voicecom for business firms.

Hot-line service. A service introduced in 1969 by CN-CP Telecommunications and Western Union is the hot-line service whereby companies in Toronto or Montreal may talk to their offices in New York City by simply picking up the handset of the telephone. When a customer picks up his handset, the exchange equipment will select the corresponding telephone at the other end. Subscribers are charged on a time-used basis.

Wide area telephone service (WATS). provided by TCTS companies, is designed for customers who make or receive many long distance calls to or from many points. WATS allows a customer to call, or to receive calls from, anywhere within one of seven zones for a flat monthly rate. These areas range in size from part of a province to all of Canada.

Voicecom service. Single-digit dialling is the main feature of this service offered by TCTS. Voicecom provides voice-only communication between specified locations via the public telephone network on a pay-as-you-use basis. By dialling a single telephone number, a Voicecom customer can reach as many as ten telephones subscribing to the same service.

16.1.1.2 Record communications

Public telegraph service. Canada's telegraph systems are operated by CN-CP Telecommunications. This company, a fusion of the telecommunications branches of the Canadian National and Canadian Pacific railways, operates telegraph offices in all ten provinces and in the Yukon Territory and Northwest Territories. Messages can be forwarded or received from any point in Canada or throughout the world via the overseas cable services. Messages are transmitted by cathode ray tube (CRT) teleprinter and facsimile equipment and telegraph networks over which the flow of public messages is controlled by computers. Messages are taken in and forwarded automatically in accordance with special programs stored in the computer's memory. The computer determines where the message is to be sent and sends it as soon as the circuits are free.

The most recent innovation is the use of cathode ray tube displays at all the larger message centres. Basically, CRT displays have television-like screens placed above a keyboard similar to a typewriter which is connected to the message-switching computer. As the operator receives a telephoned telegram message, she types it on the keyboard to read the message back to the caller and, with editing capabilities built into the displays, may make changes to the text if required. When the message is confirmed, the push of a button sends it into the message-switching computer for transmission to its destination.

Telex, the largest teletypewriter service in Canada, is also provided by CN-CP Telecommunications. Its network of 25,000 subscribers in Canada interconnects with the Western Union and RCA Alaska Communications Telex networks in the United States and with European and world-wide networks of more than 420,000 subscribers in 177 countries. Telex is a direct distance dial teleprinter system which permits a subscriber to directly dial any

other subscriber on the network. A multiple address service was offered to Telex users in 1971 through CNT's message-switching computer complex located in Toronto.

A medium-speed Telex service is offered exclusively by CN-CP Telecommunications, operating in the speed range of 100 to 250 words per minute. The subscriber may connect his own computer or data sending-receiving equipment or lease terminal equipment from CN-CP. This service provides a direct dial interconnection with subscribers anywhere in Canada to achieve a medium-speed range transfer of data from one location to another. The toll rates to subscribers are the same as for the standard-speed Telex service, that is, based on time used and distance. A variety of speeds and codes can be handled, making this service useful for data transmission.

Telepost. CN-CP and the Canada Post Office introduced a new communications service called Telepost on October 1, 1972 which fills a gap between telegrams and first class mail. It is available to CN-CP Telex and Telenet subscribers, and enables them to send messages electronically by Telex to a post office centre for delivery to the addressee.

Telex terminals have been installed in post offices across the country, where messages are placed in specially designed tri-colour envelopes and delivered through the normal mail stream. Next-day delivery is provided to virtually any postal address in Canada. There is no restriction on the length of the message. The charge is 75 cents for the service, in addition to regular Telex charges. A special delivery Telepost can be sent for an additional 40 cents.

Teletypewriter exchange service (TWX) is provided in Canada by TCTS companies. The service provides for switched, dial-up communication on a two-point and conference basis between teletypewriters at a speed of 100 words per minute or ten characters per second. TWX basic service is a standard teletypewriter for use with relatively simple message transaction application. TWX premium service has all the basic features and in addition is designed for more complex order-writing systems requiring a heavy-usage terminal capable of handling forms, form tabulation and multi-copies. There are 4,100 TWX subscribers in Canada and 35,000 in the United States. TWX subscribers can connect with overseas teletypewriter customers through International Telex.

Private wire teletype systems. Although private wire services are still a significant part of business for the telecommunications industry, the prime communications users are supplanting their private wire systems with computer-controlled store-and-forward systems.

16.1.1.3 Data communications

Quick availability of information of all kinds is vital to the management of modern industry. The member companies of the Trans-Canada Telephone System offer a wide selection of low-speed data services and a variety of medium- and high-speed computer communications facilities. In recent years, the TCTS has increased the message capacity of its coast-to-coast microwave network to meet the growing needs of data communications users, set up computer-controlled communications systems, and started work on a coast-to-coast digital data network.

Digital communications. This form of medium- and high-speed transmission is important to computer communications users because it permits the transmission of data in digital form, the language of computers. Without digital transmission facilities, data moving from one computer to another must be converted to analogue form before transmission, and reconverted to digital form before reception by the recipient computer. Another benefit of digital transmission is its low error rate.

In 1971 TCTS began development of a coast-to-coast digital data network with a trial network linking Ottawa, Toronto and Calgary which worked successfully with four trial customers through most of 1972. Work also continued on development of a high-capacity, buried coaxial cable that will carry digital and voice traffic along the heavy-usage corridor from Quebec City to southwestern Ontario.

In 1972 TCTS formed the Computer Communications Group, a pooling of the expertise of all eight member companies, permitting computer communications users to call on the resources of the entire system to meet their needs.

Data-phone service transmits data from punched cards, tape or magnetic tape over public telephone circuits or leased private lines. Data-phones take signals in digital form and convert them to analogue signals (variable tones) for transmission. At the receiving end, another

data-phone converts the analogue signals back to digital so that they are acceptable to a computer. Data-phone transmits at speeds up to 1,200 bits per second.

Data-line service uses the public telephone circuits wherever direct distance dialling is available. Data-line users can dial-up a time-sharing computer or other business machine and send or receive information at speeds up to 2,000 bits per second.

Datacom permits the transmission of data over the regular public telephone network, and consists of an access line to the network, a telephone set and a Datacom terminal which is a teletypewriter. The Datacom terminal can be used for normal teletypewriter functions and also as an input-output device associated with a time-sharing computer.

VUcom I, introduced in 1972, is a terminal which displays data on a television-like screen. When it is connected to a telecommunications network, VUcom I can be used for retrieving information from central computer banks, for checking credit ratings, etc. It can also be used as an in-house terminal for posting business orders and for process control in manufacturing. The terminal is equipped with a teletypewriter-style keyboard which the operator uses to prepare and send data.

Dataspeed service is for the movement of large volumes of data at high speeds over the public telephone network or private lines. Transmitting at 1,050 words per minute, Dataspeed takes only half an hour to move the same amount of information that would keep a teletypewriter, operating at 100 words per minute, occupied for 4½ hours. Information to be transmitted is recorded on punched paper tape which then speeds through a machine that can "read" the code represented by the arrangement of the punched holes. As the tape is read, signals are sent to the machine on the receiving end of the circuit.

Multicom is a wideband data service that allows the customer to pay only for transmission time used. It was introduced on a nation-wide basis in 1970. There are three classes of Multicom service and a subscriber can dial-up any other subscriber in Canada on the same class of service. With features designed specifically for data transmission, as opposed to voice transmission, Multicom provides reliability and low error rates.

Multicom I provides data and voice transmission between specified locations at speeds up to the capability of the public telephone network (2,000 bits per second). Users can connect with each other over the direct distance dial network.

Multicom II provides medium-speed data transmission up to 4,800 bits per second. It is functionally segregated from the direct distance dial network, but is integrated to the extent of using the same switching stations, microwave towers and other facilities. Provided the customer's business machines have the capability, data can be transmitted both ways simultaneously on Multicom II.

Multicom III provides transmission at speeds of 19.2, 40.8 and 50.0 kilobits per second over a network integrated with the regular telephone network but is, like Multicom II, functionally separate. Multicom III permits simultaneous voice and data transmission.

TCTS also provides wideband data channels that offer a special high-speed service to customers who need such transmission facilities on a full-time or dedicated basis. Unlike Multicom, wideband data channels are paid for on a 24-hour basis and operate outside the public telephone network.

Broadband exchange service. In 1967, CN-CP Telecommunications introduced an automatic voice-data switching system known as broadband exchange service, a high-quality, rapid communications system. It is the first such system to operate in Canada and the second in the world. Broadband has more than tripled the transmission speeds for switched data services; furthermore, it has the capability, on customer demand, of transmitting computer data at 51,000 words per minute, or more than 50 times faster than the top speed reached by conventional switched networks. The Royal Canadian Mounted Police was the first organization to be tied into this modern network, using it for high-quality transmission of fingerprints, photographs and documents between headquarters at Ottawa and divisional headquarters at Montreal, Toronto, Winnipeg, Edmonton, Regina, Vancouver, Fredericton, Halifax and St. John's.

The name broadband exchange service is derived from the actual system since it is designed to permit various bandwidths, depending on the communications needs of subscribers. The system can switch four bandwidths; four and eight kilohertz for voice,

facsimile and data (from 1,000 to 3,000 words per minute); 16 kHz for high fidelity radio program transmission and facsimile; and 48 kHz for high-speed computer-to-computer data exchange (51,000 words per minute) and high speed for facsimile. The four-kilohertz bandwidth is now operational and the other bandwidths will become available upon customer demand. Transmission is carried by the CN-CP microwave system using frequency diversity techniques to provide a high degree of reliability. In other words, the transmission is carried over different circuits at the same time, one being the back-up system for the other.

Each subscriber has in his office a voice-data subset which can be changed from voice to data communication. The subset features push-button "dialling" and the customer, to reach a distant point, simply keys a series of seven digits. The first three digits designate the distant exchange, the fourth digit indicates the desired bandwidth and the last three digits select the line of the desired party. A re-ring button is included so that the customer may signal the distant party to revert to voice communication during or after sending data. A feature of broadband is abbreviated keying, where customers may contact frequently called stations by pushing a two-digit code instead of the normal seven digits. Broadband will establish connections, including keying time, within five seconds, or two seconds on the special "hot-line" service. Actual connection time after keying or "dialling" is less than two seconds. Another feature of broadband is conference calling, where a subscriber, by pushing a two-digit code, will automatically contact a predetermined list of parties needed for the conference. Subscribers are charged on a "pay-as-you-use" basis.

Computer-controlled transmission systems. CN-CP Telecommunications and the Trans-Canada Telephone System operate store-and-forward message-switching computers which control the flow of message traffic. CN has operated in this field since 1964.

CN's system provides a switching medium for Air Canada, CP Air, regional air lines such as PWA, Transair, Quebecair, EPA, and CN administrative message traffic, and also controls and transmits information on CN's reservation system. To make a reservation, a computer card is marked and inserted into a card reader and a reply returns via a teleprinter confirming the reservation. A third-generation computer installed for CN in 1968 is performing major store-and-forward message switching functions for the Atmospheric Environment Service: when the computer finds a weather report from any of the 500 weather stations throughout Canada, it will tell the station equipment to transmit the report into the computer, which then determines where and at what time of the day the information is to be sent.

Commercial telegrams, entered on local CRT sets at most major offices, are forwarded by mini-computers to CN's third-generation message-switching computer complex for switching across the country.

A new time-shared, computer-directed data-and-message system called Telenet was introduced by CN-CP Telecommunications in 1971. The Telenet system controls a number of subscriber networks by central computers. The message-switching computer centres handle many customers but each customer's network is completely private. In its initial phase, Telenet will be confined to message-switching and related features such as speed and code conversions, message storage and retrieval, high-speed data handling, interface with customer-owned computers and message refile. A single message may be transmitted for delivery to as many as 32 stations by one group-routing indicator at one time. The computers recognize two levels of priority; messages marked "quick" are handled first. Message-switching computers are located at CN offices in Toronto and CP offices in Montreal and all Canadian subscribers' requirements are routed by one of these centres. Future plans call for switching-computer centres at Vancouver, Edmonton, Winnipeg and Halifax. Various options and capabilities of Telenet will enable CN-CP to custom-design a system to meet specific needs of individual subscribers.

Message-switching data service. TCTS companies provide a message-switching data service (MSDS) which controls teletypewriter transmissions by computer. Message traffic between TWX terminals and private line terminals supplied by the TCTS companies can be so controlled. Some businesses have both TWX and private line teletypewriter networks. TWX operates on a switched network of 100 words per minute and private line teletypewriters can operate at 60, 75 or 100 words per minute. In addition, the TWX and private line teletypewriters may use different codes. Normally, teletypewriters using different speeds and codes cannot communicate, but the MSDS computer makes this possible. The computer can

also store messages destined for a teletypewriter that is busy at the time the message is sent. Later on the computer will check the recipient machine and will automatically forward the message when it is free. Developed in 1967, MSDS has relieved many large Canadian firms of the chore of manually sorting and forwarding inter-company teletypewriter messages.

Store-and-forward message switching dates back to the early 1940s when TCTS provided electro-mechanical devices which were installed on each customer's premises. The computer in today's switching system is located on telephone company premises, resulting in better maintenance. The computer not only operates faster than electro-mechanical switching, but also provides customers with additional features.

Software controlled communications service features a mini-computer that acts as a bridge between the communications networks and a customer's computer, allowing the latter to reach a wide variety of remote terminals using different speeds and codes. It can be re-programmed to cope with changing conditions, a function which previously could be performed only by physical modification of control units. The mini-computer can also direct traffic and diagnose trouble on the communications circuits.

16.1.1.4 Public and private commercial microwave facilities

Railways. CN-CP Telecommunications operates a microwave system extending from Moncton, NB to Nanaimo, BC, which is used for television, telephone and data-relay purposes. During 1972, a connection was provided to Campbellton, NB, and the capability of handling telephone and data traffic was added along the Toronto - Hamilton - St. Catharines - Kitchener - London - Windsor route, previously used only for television purposes. Extensions to the microwave system are under construction on the Moncton - Halifax - Sydney and Kamloops - Kelowna - Penticton - Trail - Nelson routes.

On its own, CN has microwave facilities linking Newfoundland to the Maritime Provinces at Sydney, NS, and across the Strait of Belle Isle to Labrador and to Quebec at Blanc Sablon. In addition, CN has installed a microwave system from Grande Prairie, Alta., through the Yukon Territory to Alaska to carry telephone and data traffic; it serves both civil and military organizations. In co-operation with Alberta Government Telephones, a combination microwave and tropospheric scatterwave system has been established to connect Alberta to Yellowknife, Fort Simpson and Lady Franklin Point in the Northwest Territories. A combination microwave-scatterwave system links the Yukon Territory with the Mackenzie Delta area of the Northwest Territories. Microwave is used from Whitehorse to Keno and a tropospheric scatterwave system bridges the Richardson Mountains from Keno to Arctic Red River; from there, microwave is used north to Tuktoyaktuk. A scatterwave system hurls transmission up to the troposphere where it is bounced back to the next station some 200 miles away. A microwave system is being built by CN between Fort Simpson and Norman Wells.

The Quebec North Shore and Labrador Railway has developed a microwave system extending into northern Quebec to provide communication for mining operations and to serve some civil communication purposes. Ontario Northland Railway operates a microwave system connecting northern Ontario and James Bay for military and civil communication. The British Columbia Railway makes extensive use of 6,000 Mc/s microwave facilities linking Vancouver with Prince George, Dawson Creek and Fort Nelson, and the company is now constructing a branch of this system linking Fort St. James to Dease Lake.

Satellite communications facilities. Telesat Canada launched the world's first geostationary communications satellite designed for domestic commercial use, ANIK I, on November 9, 1972. By December 1, ANIK I was operationally functional in its internationally designated orbital position over the equator at 114° W. The satellite maintains a stationary orbit at an altitude of 22,300 miles, rotating with the earth every 24 hours and therefore constantly maintaining the same relative position over the equator.

Initial commercial service to Telesat's customers commenced during January 1973 through a network of some 37 earth stations located across the length and breadth of Canada. Basically, satellite communication is one long microwave link. The clarity and strength of transmission provided by satellites is comparable to that of existing microwave systems but with the added advantage of providing virtually all forms of telecommunications to areas which had not previously been well serviced.

ANIK I and its in-space back-up satellite, ANIK II, will provide television distribution in both English and French to many parts of Canada not now served by terrestrial facilities.

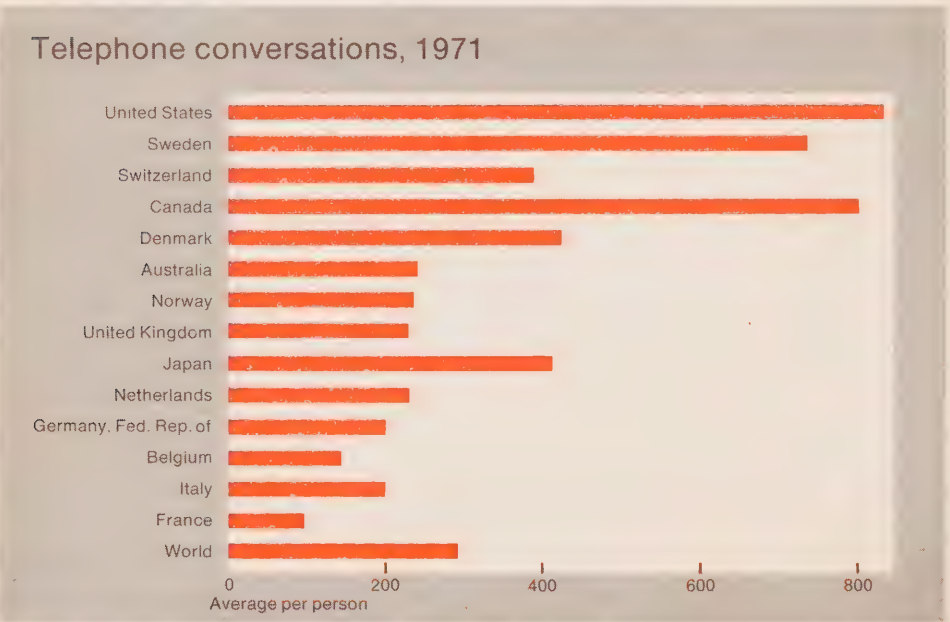

improve telephone communications in northern Canada and supplement existing microwave systems servicing southern Canada. The ANIK generation of satellites has a projected minimum life cycle of seven years. Telesat Canada has signed contracts with the Canadian Broadcasting Corporation for three radio frequency (RF) channels for English- and French-language television distribution; with a consortium of telecommunications common carriers, including the members of the Trans-Canada Telephone System and CN-CP Telecommunications, for two RF channels to provide voice and data communications between Toronto and Vancouver; and with Bell Canada for two RF channels to provide improved telephone communications in northern Canada. During 1973, it is expected that a contract will be signed between Telesat Canada and the Canadian Overseas Telecommunication Corporation for service starting in early 1974, linking the Canadian end of a new transatlantic cable, CANTAT II, via satellite to central Canada. In addition, the company is negotiating with a number of US telecommunications carriers for the leasing of RF channels on ANIK II to provide US service via satellite in the intervening period until US systems are established in space. By the end of 1972, Telesat Canada was already expanding its initial earth station network to provide for an additional 15 locations for improved telephone communications in the northern parts of Canada during 1973 and 1974.

Because of its early entry into the field of commercial satellite communications, Telesat Canada has acquired a marketable body of managerial and technical expertise in this rapidly evolving field.

16.1.2 Telephone and telegraph statistics

Telephone statistics. In 1971 there were 1,490 telephone systems operating in Canada compared with 1,716 in 1970; of these systems, 1,171 reported in 1971 and 1,376 in 1970 (Table 16.1). Co-operative systems in rural districts decreased in number from 1,256 to 1,074 in the same comparison and incorporated companies from 84 to 67. The largest of the incorporated companies, Bell Canada, which operates throughout the greater part of Ontario and Quebec and in Newfoundland and the Northwest Territories, served 61% of all the telephones in Canada and the British Columbia Telephone Company, also shareholder-owned, served 10% of the total in 1971. The number of telephones in use continues to increase at the rate of about 5% annually.

Table 16.2 shows the distribution of telephones in use in 1971. Of the total, 71% were residential telephones, and of these, 62% were on private lines, and extension telephones and

those on party lines accounted for nearly 19% each. Of the business telephones, nearly 37% were on private branch exchanges, 28% were on private lines and nearly 24% were extensions. Less than 1% of the total were coin-operated. Ontario had the largest number of telephones at 52 per 100 population, followed closely by British Columbia and Alberta.

The major telephone systems record completed calls on representative days throughout the year and on this basis estimate the number of local conversations which, added to the actual count of long distance calls, gives their total volume of business. Estimates are included for the smaller systems. Table 16.3 shows that Canadians made an average of 779 calls per person in 1971. Telephone users in the US exceeded this figure at 830 calls per person, and Swedish callers were third at 687 calls.

The steady increases in capitalization, revenue and expenditure of telephone companies together with the number of employees and salaries and wages paid are shown for the years 1967-71 in Table 16.4. Provincial figures for 1971 are given in Table 16.5.

Telegraph statistics. Nine telegraph and cable companies operated in Canada during 1971 but, as already stated, telegraph service is provided mainly by the telecommunications departments of the two major railway companies. The number of telegrams sent continues to decline year by year, giving way to other types of message transmission, but the number of cablegrams has been rising. The business of telegraph and cable companies appears to be changing from one of handling messages directly to one of leasing equipment for the transmission of messages by others. Revenues from the latter source have been rising over the past several years and have been the main factor in the steady advance in total operating revenues (Table 16.6). Total cost of property and equipment for all telegraph and cable companies was \$606.7 million in 1971, increasing from \$570.6 million in 1970.

16.1.3 Federal regulations and services

The Department of Communications was established on April 1, 1969. The duties, powers and functions of the Minister of Communications extend to and include all matters relating to telecommunications over which the Parliament of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada; and the development and utilization generally of communication undertakings, facilities, systems and services for Canada. He is responsible for the administration of the Telegraph Act (RSC 1970, c.T-3), the Radio Act (RSC 1970, c.R-1) and the Canadian Overseas Telecommunication Corporation Act.

The Department is made up of the Communications Research Centre formed from the Department of Defence Research Telecommunications Establishment; the Telecommunications Management Bureau transferred from the Ministry of Transport; and the Policy, Plans and Programs Branch. The work of the Research Centre ranges from fundamental studies on materials and circuits to the design of advanced high-reliability avionics and aerospace electronic systems. The Telecommunications Management Bureau is responsible for: development of policy and plans with respect to national and international telecommunications by satellites, cables and other media including relations with the Canadian Overseas Telecommunication Corporation and participation in the work of the International Telecommunications Union and its subsidiary organs; establishment and review of the telecommunications requirements of the federal government departments and agencies throughout Canada, and co-ordination of the planning and provision of facilities to meet these needs; planning of emergency measures and administration of the Emergency National Telecommunication Organization (ENTO); development and maintenance within the Bureau of a centre of competence in the latest telecommunications technology; and administration of the Radio Act and Regulations including allocation and assignment of radio frequencies, radio provisions of the Canada Shipping Act, Ship Station Radio Regulations, the Telegraphs Act and the Regulations thereunder covering the licensing of transoceanic cables. The Policy, Plans and Programs Branch is responsible for the development of long-range plans and policies and the co-ordination of investigations and research programs that will improve knowledge about the Canadian communications environment.

Canadian Transport Commission. Telephone and telegraph companies incorporated under federal legislation are subject to the jurisdiction of the CTC in the matter of rates and practices under the provisions of the Railway Act. Previously the CTC regulated rates only in those cases

in which a charge was made to the general public; recent amendments to the Railway Act extend the jurisdiction of this body to cover rates charged for private wire services as well. International telegraph and telephone communications are handled subject to the International Telecommunication Convention and its Regulations, or under regional agreements, or both. Overseas cables landed in Canada are subject to the External Submarine Cables Regulations under the Telegraphs Act.

Radiocommunications in Canada, except for those matters covered by the Broadcasting Act, are regulated under the Radio Act and Regulations which, in addition to providing for the licensing of radio stations performing terrestrial radio services, also provide for licensing earth and space stations engaged in space radiocommunication services, and the Canada Shipping Act and Ship Station Radio Regulations. Radiocommunications in Canada are administered in accordance with the International Telecommunication Convention and Radio Regulations annexed thereto; the International Civil Aviation Convention; and the International Convention for the Safety of Life at Sea. A number of Canada - United States conventions and agreements are also in effect, such as: the Convention for the Promotion of Safety on the Great Lakes by means of Radio; the Convention relating to the operation by citizens of either country of certain radio equipment or stations in the other country; the Agreement relating to the Co-ordination and Use of Radio Frequency above Thirty Megacycles per Second; the Television and FM Agreements; and the Agreement relating to the operation in either country of radiotelephone stations licensed in the Citizens Radio Service of the United States and the General Radio Service of Canada. In addition, Canada is a party to the North American Regional Broadcasting Agreement.

The Canadian Radio-Television Commission issues licences for broadcasting undertakings under the Broadcasting Act of 1968. However, the licences are not issued unless the Minister of Communications certifies to the Commission that the applicant has satisfied the requirements of the Radio Act and Regulations thereunder, and has been or will be issued a Technical Construction and Operating Certificate under that Act. Broadcasting undertakings include radio (AM and FM) and television broadcasting stations, community antenna television (CATV) systems, and network operations. The technical rules and procedures for the allocation of frequency channels and installation and technical operation of broadcasting station facilities are set forth in the Department's *Broadcasting procedures and radio standards specifications*. These documents form the basis for determining the acceptability of applications for Technical Construction and Operating Certificates and for the control of the technical operation of broadcasting undertakings. The availability of the technical facilities for broadcasting is subject to the terms of the North American Regional Broadcasting Agreement, the Canada - US Television Agreement and the Canada - US FM Agreements.

Telesat Canada, a corporation created by an Act of Parliament, June 27, 1969, is responsible for Canada's domestic communications satellite. It has a unique form of financing — the government, designated common carriers, and the general public will each be offered about one third of its shares. The corporation's annual report is tabled in the House of Commons by the Minister of Communications.

Licensing and regulation of radio and TV stations. Licensing is the federal government's method of maintaining control over radiocommunications in Canada. Under the Radio Act, radio stations (other than those used in broadcasting undertakings) employing any form of Hertzian wave transmission, including television and radar, must be licensed by the Department of Communications, unless exempted by regulation. The following General Radio Regulations basically provide for six classes of radio station licence: Coast, Land, Mobile, Ship, Earth and Space. Various categories of service may be authorized under each of these classes, e.g., public commercial service, private commercial service, amateur, experimental, etc. The number of licences in force for radio stations in Canada in the year ended March 31, 1972 was 268,810 compared with 256,327 for the previous year. These figures include stations operated by federal, provincial and municipal government departments and agencies, stations on ships and aircraft registered in Canada and stations in land vehicles operated for both public and private purposes, but they do not include stations in the broadcasting service. Licensing activities during the year ended March 31, 1972 with comparative figures for the previous year shown in parentheses, include: applications 31,608 (29,125), authorizations 27,085 (23,537), licence amendments 26,139 (22,272), cancellations

18,711 (18,198), total licences in force 268,810 (256,327), and net increase in licences 12,483 (10,538).

Radio standards in general are drawn up in consultation with the electronic industry and users of radio, taking into account such technical factors as those which affect frequency spectrum utilization, reliability of apparatus, and compatibility under conditions of service. The Department of Communications maintains an engineering laboratory to develop standard specifications and for testing apparatus to ensure compliance with the standards.

Licensing involves the assigning of specific frequencies to each station. Bands of frequencies are allocated for various types of services, often on a shared non-interference basis. Frequency selection, compatibility evaluation, domestic registration (computerized data base with a file size of more than 53.5 million characters), and notification with the International Frequency Registration Board (IFRB) of the International Telecommunications Union at Geneva are carried out to ensure efficient use of the spectrum. Assignments are made in keeping with international and domestic statutes and regulations, regional agreements and domestic policies. The IFRB is notified of frequency assignments for technical examination and for inclusion, with appropriate "in service" dates, in the Master International Frequency Register so that Canadian assignments will receive international recognition and be given protection from interference by foreign stations. In service dates are necessary when determining prior right to the use of particular frequencies.

The enforcement activities of the Telecommunications Regulation Branch, Department of Communications, include the technical inspection of all radio stations including the monitoring and measurement of their radiated signals to ensure compliance with the regulations and conditions of licensing; the location and suppression of radio interference; the technical examination of candidates for the various classes of certificates of proficiency in radio which must be held by the operators of radio stations; and the direction of prosecutions in the courts. These functions are carried out through personnel located at 39 radio regulations inspection offices, 11 fixed monitoring stations, eight mobile monitoring vehicles, and six regional spectrum observation centres across Canada.

Radio aids to marine and aeronautical navigation. Federal services in aid of marine and aeronautical navigation are provided by the Ministry of Transport. Six regional offices, located at Vancouver, Edmonton, Winnipeg, Toronto, Montreal and Moncton, are responsible for the construction and operation of the facilities.

Radio aids to marine navigation are provided for radio-equipped Canadian vessels and foreign ships using Canadian waters. This safety and communications service for shipping covers the east and west coasts, the Great Lakes, the St. Lawrence River and Gulf, Hudson Bay and Hudson Strait and includes regularly broadcast weather reports, storm warnings and notices of danger to navigation. Ships at sea may obtain medical advice from any coast station. The stations carry out communications by radiotelegraph and/or radiotelephone and most of them provide connections to land telephone lines. Halifax (VCS) and Vancouver (VAI) stations provide long-range radiotelegraph and radiotelephone services to ships. Coast stations on Hudson Bay and Hudson Strait provide, in addition to their regular services, commercial communications for posts of the Hudson's Bay Company and various prospecting and development organizations, make weather observations, handle administrative traffic and assist aircraft with information, landing conditions, etc.

Automatic radiobeacon stations are maintained on the east and west coasts, the St. Lawrence River and Gulf, the Great Lakes and Hudson Bay and Hudson Strait, giving navigational aid to mariners by transmitting signals on which bearings may be taken. There are five types of radiobeacons in operation: sequenced, continuously operating (marine and dual-purpose marine/air), marker, ship-calibrating and periodically operating. Sequenced radiobeacons are arranged, where possible, in groups up to a maximum of six stations transmitting in sequence on a common frequency, the sequence being repeated continually regardless of weather conditions. Continuously operating marine radiobeacons transmit a continuous carrier modulated by a tone which is keyed at fixed intervals to provide the identifying Morse characteristic. Continuously operating dual-purpose marine/air radiobeacons are provided for the use of both ships and aircraft. They transmit a continuous carrier modulated by a tone which is interrupted eight times per minute for the transmission of a one- or two-letter identifier. Marker radiobeacons, with a range of ten nautical miles, do not have a characteristic Morse identifier, but can be identified only by the operating frequency. They

operate continuously, transmitting $\frac{1}{2}$ -second dashes for $13\frac{1}{2}$ seconds then remaining silent for $1\frac{1}{2}$ seconds. Ship-calibrating radiobeacons are available at certain locations to enable ships fitted with direction finders to calibrate their equipment. These radiobeacons operate for a six-hour period on the advertised frequency. Periodically operating radiobeacons are located in areas where there is a limited marine requirement. They normally transmit their characteristic signal for one minute in every ten minutes continuously, using continuous carrier and tone-keyed modulation. This type of automatic radiobeacon is designed to operate unattended for long periods of time in areas that are isolated or inaccessible for part of the year.

Loran is a long-range radio aid to marine and air navigation providing accurate fixes at distances up to 750 miles by day and 1,500 miles by night. Two Loran stations operate in Nova Scotia, three in Newfoundland and two on the west coast. These stations, in conjunction with Loran stations of the United States Coast Guard, give service to ships and aircraft plying the North Atlantic and Pacific oceans. Decca is a short-range radio aid to navigation providing accurate fixes at distances up to 250 miles. Four chains of Decca stations are in operation — the Newfoundland, the Nova Scotia, the Anticosti and the Cabot Strait — giving service to ships off Newfoundland and Nova Scotia and in the St. Lawrence River and Gulf.

It has become general practice to equip merchant ships with radar and important buoys are fitted with radar reflectors to increase their radar visibility. A shore-based radar installation is in operation on the Lion's Gate Bridge across the entrance of Vancouver Harbour. Eight radar responder beacons are in year-round operation on the east coast, one on the west coast, and three in the St. Lawrence River; eight in the western Arctic and three in the Great Lakes are in operation during the navigation season. Low power transceivers are provided for use in emergencies at lighthouses, particularly at locations that would otherwise be completely cut off from assistance in case of illness.

Radio aids to air navigation are provided by the Ministry of Transport from coast to coast and from the United States border to the Arctic regions for use by Canadian aircraft and foreign air carriers flying over Canadian territory.

Low frequency radio aids operating on the frequency band 200-415 kHz are generally located within a distance of 50 to 100 nautical miles of each other to form the low frequency airways system. A few are located "off airways" in remote regions and a number of low power radiobeacons serve major airports as terminal and landing aids. The Ministry of Transport operates 345 en route, low frequency aids (20 of which are the older type radio range class) and 60 low power terminal radiobeacons. These facilities are used primarily in association with airborne direction-finding equipment. Voice channels on a number of low frequency aids are also used for aircraft communications and weather broadcast purposes.

Operating on the higher frequency bands VHF (very high frequency) and UHF (ultra high frequency), the Ministry of Transport operates 65 VHF omnidirectional ranges (VOR), 63 instrument landing systems (ILS) and 32 tactical air navigation systems (TACAN). At 30 locations the VOR and TACAN station are co-located and the complete station is called a VORTAC.

The VOR and VORTAC stations form the VHF airways system which closely parallels the older low frequency airways system. Additional stations are being installed on a continuing basis. Use of the VOR permits the pilot to select any desired course to fly to the station and, in the case of a VORTAC, additional information is provided which is a readout of the distance of the aircraft from the station.

Instrument landing systems provide radio signals which permit aircraft landings during periods of low visibility. Radio transmitters provide lateral and slope guidance to the approach end of the runway and also provide an indication of the distance to the runway threshold.

For air traffic control purposes, there are three main classes of radar in operation at Canadian airports consisting of 15 airport and airways surveillance radars with a range of 150 nautical miles, eight airport surveillance radars with a range of 50 nautical miles, and eight precision approach radars, which are short-range radars used for landing at major airports.

Radiotelephone communications are provided by 111 ground stations called Aeradio Stations, from which pilots may obtain weather data, air traffic control instructions and other information concerning flight safety. These stations operate for the most part on the VHF band but in the North and on international routes HF is utilized to provide the necessary long-range coverage. Thirteen of the 111 stations engage in international communications

services for Canadian and foreign air carriers. All these ground stations are connected to a fixed teletype network of more than 48,000 circuit miles to meet aeronautical communications needs.

16.1.4 Overseas services

The Canadian Overseas Telecommunication Corporation (COTC) was established in 1950 to maintain and operate external telecommunication services for the conduct of public communications by cable, radiotelegraph and radiotelephone and any other means of telecommunication between Canada and overseas points; to make use of all developments in cable and radio transmission and reception for external telecommunication services; and to conduct investigation and research with the object of improving and co-ordinating such telecommunication services with the telecommunication services of other nations. Increased use of all types of overseas telecommunication resulted in the COTC reporting a net profit of \$6.9 million for the year ended March 31, 1972; income for the year amounted to \$36.8 million.

The services currently being provided are as follows: direct telephone service between Canada and Antigua, Argentina, Australia, Austria, Barbados, Belgium, Bermuda, Brazil, Britain, Chile, Denmark, Finland, France, Federal Republic of Germany, Greece, Hong Kong, Iceland, India, the Irish Republic, Islands of St. Pierre and Miquelon, Israel, Italy, Jamaica, Japan, the Netherlands, New Zealand, Norway, Panama, Peru, Philippines, Singapore, South Africa, Soviet Union, Spain, Sweden, Switzerland, Trinidad, Venezuela and Yugoslavia; direct Telex service between Canada and Argentina, Australia, Austria, Barbados, Belgium, Bermuda, Brazil, Britain, Denmark, Finland, France, Federal Republic of Germany, Greece, Hong Kong, Iceland, Italy, Jamaica, Japan, Malaysia, Mexico, the Netherlands, New Zealand, Norway, Peru, Philippines, Portugal, Singapore, South Africa, Soviet Union, Sweden, Switzerland, Trinidad and Venezuela; direct telegraph service between Canada and Australia, Austria, Barbados, Belgium, Bermuda, Brazil, Britain, China, Cyprus, Denmark, Finland, France, Federal Republic of Germany, Hong Kong, Iceland, India, Islands of St. Pierre and Miquelon, Italy, Jamaica, Japan, the Netherlands, New Zealand, Norway, Peru, Soviet Union, Sweden, Switzerland and Trinidad; and Datel 600 service between Canada and Australia, Belgium, Britain, Federal Republic of Germany, Hong Kong, Italy, the Netherlands, New Zealand, Norway, Spain, Sweden and Switzerland.

The first transatlantic telephone cable, a joint project with the British Post Office, the American Telephone and Telegraph Company, Eastern Telephone and Telegraph Company and the Corporation, was brought into service in 1956. Since 1961, the following cables have been added: The Canada - Greenland - Iceland 24-circuit telephone cable (ICECAN), a two-party enterprise of the Great Northern Telegraph Company of Denmark and COTC; the Canada - Britain 80-circuit telephone cable (CANTAT); the Commonwealth Trans-Pacific 80-circuit telephone cable, a four-party enterprise of Canada, Britain, New Zealand and Australia connecting Vancouver and New Zealand and Australia via Hawaii and Fiji (COMPAC); the South East Asia Commonwealth 80-circuit cable, a six-party enterprise of Canada, Britain, New Zealand, Australia, Malaysia and Singapore connecting Australia, Hong Kong, Singapore and Kuala Lumpur via New Guinea and Guam (SEACOM); the Canada - Bermuda 640-circuit cable, a two-party enterprise of Canada and Britain (CANBER); and a number of circuits for Canadian purposes acquired in telephone cable systems connecting Bermuda, Jamaica, Puerto Rico and the United States. External cables landed in Canada licensed to COTC totalled 14,979 nautical miles; Western Union International Inc. accounted for 4,121 nautical miles of cable, Eastern Telephone and Telegraph Company for 4,680 nautical miles, and the New Brunswick Telephone Company Limited for 0.3 mile from Campobello Island to Lubec, Maine.

The Corporation also operated direct circuits via the Atlantic satellites with Argentina, Austria, Barbados, Belgium, Brazil, Britain, Chile, Denmark, France, Federal Republic of Germany, Greece, Italy, the Irish Republic, Israel, Jamaica, the Netherlands, Spain, Switzerland, Trinidad and Tobago, and Venezuela. The Corporation owns and operates two earth stations at Mill Village, NS with the large capacity satellites of the International Telecommunications Satellite Organization (INTELSAT) IV series. Mill Village I was constructed initially for the Department of Communications for research and experimentation. The Corporation also operates direct circuits via the Pacific satellite with Australia, Hong Kong, Japan, the Philippines and Singapore. The Corporation owns and operates an earth station at Lake Cowichan, Vancouver Island, linked to an INTELSAT IV satellite. In addition

to normal use of its system for television, public telephone, switched data, Telex and telegraph message traffic, capacity is available for private leased circuits.

Canada, represented by Canadian Overseas Telecommunication Corporation, is a signatory to the Operating Agreement of INTELSAT set up by participating nations for the development and operation of a global communications satellite system. The Corporation also represents Canada on the Commonwealth Telecommunications Council.

The Corporation, under a long-term agreement, has under charter from the Ministry of Transport the CCGS John Cabot, a combined ice-breaker/cable-repair ship used mainly for repairing cables in the western North Atlantic Ocean. The Corporation also operates a cable depot at St. John's, Nfld.

16.2 Radio and television

The broadcasting system in Canada has both public and private components. The earliest legislation with respect to Canadian broadcasting was passed in May 1932, creating the Canadian Radio Broadcasting Commission, but the basic principles for radio and television broadcasting have been revised over the years. The Broadcasting Act of 1968 entrusted the Canadian Radio-Television Commission under Part II of the Act with the direction of the Canadian broadcasting system. The Commission regulates and supervises all aspects of the broadcasting system except for technical matters relating to the planning and construction of broadcasting facilities, which are the responsibility of the Department of Communications.

The Canadian Broadcasting Corporation, a publicly owned corporation established by Act of Parliament (now Part III of the Broadcasting Act), provides the national broadcasting service in Canada. Its radio and television facilities extend from the Atlantic Ocean to the Pacific, and north to the Arctic Circle. The CBC, created in 1936 to replace the earlier public broadcasting agency that had operated since 1932, is financed mainly by public funds voted annually by Parliament, with supplementary revenue obtained from commercial advertising. The head office is in Ottawa and the main production centres are Toronto for the English networks and Montreal for the French networks. Regional centres operate across the country.

An applicant for a licence to establish and operate an AM, FM or TV broadcasting station, a community antenna television system (CATV) or a network files application forms with the Secretary of the CRTC. If found acceptable by the Commission, a public notice of the application is issued in the *Canada Gazette* and in one or more newspapers of general circulation within the area served or to be served by such station or system prior to the holding of a public hearing. The same procedure applies to an application for renewal or amendment of an existing licence.

16.2.1 Cable television

Basically, cable television is an antenna system linked to the individual subscriber's set by cable through a series of amplifiers, making it possible to bring in signals he could not otherwise obtain. Cable systems are capable of carrying AM and FM radio as well as VHF and UHF television signals. For this service, the subscriber customarily pays an installation fee and a monthly rental of about \$5. Systems range in size from 38 with fewer than 100 subscribers to five with more than 100,000. As at March 1972 there were 361 cable television systems operating in Canada, serving about 30% of all urban households in the country. Of these systems, 116 were producing local community programming on a regular basis, with an average of 18.2 hours of such programming being broadcast weekly.

Cable television is recognized as an integral part of the Canadian broadcasting system and policies and regulations that concern it must take into account the effects on other aspects of the national system. Cable television systems (CATV) are operated by private companies, each of which must be approved technically by the Department of Communications and licensed by the CRTC.

In July 1971, the CRTC announced its policy on cable television, emphasizing its mandate to provide the best possible service and widest choice from every source for the Canadian viewer. It is recognized that cable television provides an improved picture quality and extends the service area of companies dealing with broadcast transmissions. It has given viewers a greater variety of programs and has made possible a greater information flow. The policy established the composition of the basic services that cable television must provide, including CBC and other Canadian local and regional stations, a community channel and, where

requested by provincial authorities, access for educational programming. The CRTC will authorize cable television systems to carry distant stations using microwave or other electronic communication systems which technically extend the receiving system. However, the number of channels carrying signals which are received by microwave from commercial stations not licensed by the Commission will generally be limited to three. The CRTC may limit the authorization to fewer of these signals if it considers that local television service would otherwise be jeopardized.

The capacity of cable television systems to import distant signals can fragment local audiences and can have an adverse effect on local broadcasting outlets. Cable systems take programs off-the-air from locally licensed television stations and distribute them in numerous other areas without contributing to the production cost of these programs. The CRTC has concluded that cable television systems should pay for the Canadian programs and services received over the air by buying additional Canadian programs from local and regional licensees as well as from network sources for play or replay on their systems, thus providing additional exposure for Canadian programs. A policy of program deletion and replacement, where identical programs are scheduled by stations already serving the community, will enable stations already licensed to serve an area to regain their portion of the local audience without reducing or restricting viewer choice. The CRTC also encourages a similar policy for commercial messages. Although cable licensees will not be permitted to sell advertising, they may remove the commercial content of signals not licensed to serve Canada and insert replacement commercial messages sold by Canadian television stations.

16.2.2 Television broadcasting

Television programming began in Canada in 1952 in Montreal and Toronto, and colour broadcasting in 1966. Of the estimated 6.0 million households in the country, approximately 5.3 million are equipped with one or more television sets. An estimated 20% of Canadian households had colour television sets in 1972 with highest colour ownership in Alberta at approximately 30%, and lowest in Newfoundland at 8%. Two of the four Canadian television networks are operated by the CBC, one in English and one in French. The other networks are the English-language network of the CTV Television Network Limited which extends across Canada, and the French-language network TVA, at present serving only Quebec. In addition, the CRTC has licensed a third Canadian television network, Global Communications Limited, to begin operations on January 1, 1974. Initially, this network will cover Ontario.

As at December 31, 1972, Canada had 100 originating television stations, and 418 rebroadcasting stations. The CBC owned and operated 19 English- and ten French-language originating stations, as well as 108 English and 28 French rebroadcasting stations. There were 36 privately owned English-language affiliates of the CBC, with 152 rebroadcasting stations, and seven French-language affiliates operating another 27 rebroadcasting stations. The CTV television network operated 16 originating stations across Canada, with a total of 97 rebroadcasting stations. The TVA network had three originating stations. In addition, there were nine independent originating stations in the English language, operating six rebroadcasting stations.

From the start, the development of Canadian television was complicated by geographical and language factors. About half the people of Canada live near the southern border and have access to programs broadcast by one or all of the major US networks. This fact and the need to maintain a Canadian identity and to articulate Canadian interests contributed to the rapid development of Canadian television services. Toronto and Montreal now rank among the world's principal television production centres in the English and French languages; Vancouver, Edmonton, Winnipeg, Ottawa, Quebec City, Halifax, Moncton and St. John's are the regional production centres. The successful launching of the Canadian communications satellite ANIK I in late 1972 and the beginning of its operations in early 1973 will play an increasingly significant role in the efforts to bring radio and television services to the more remote parts of the country, particularly in the Canadian North.

16.2.3 Radio broadcasting

Despite the impact of television, radio remains an important means of communication for Canada's population. The CBC networks provide a wide variety of programming on a national basis and private local stations attract a large percentage of the listening audience. About 97% of the households in Canada are equipped with radio. In about half of them there is more than

one set, and often there is a radio in the car and one or more portable transistor sets. It is estimated that there is one radio for every two persons.

To serve this audience, the CBC operates an English-language network and a French-language network, and there are a considerable number of privately owned radio stations, some affiliated with the CBC networks and some serving an entirely local function. Of the 345 AM stations in operation in 1972, 38 were owned by the CBC and 307 were privately owned. The English network consisted of 29 CBC owned and operated stations and 69 private affiliates; the French network was made up of nine CBC stations and 38 private affiliates. There is also a second French-language network consisting of five private radio stations. The 200 unaffiliated private stations offered a basically local community service. Of the 87 FM stations, ten were operated by the CBC and 77 were privately operated. The private stations are financed entirely from advertising revenue.

In addition to a coast-to-coast English network and a French network that reaches a large proportion of the country's French-language population in eight of the ten provinces, the CBC provides regional and local services. Its networks extend over more than 28,000 miles. It has its own news service and offers a wide variety of programs in information, public affairs and entertainment. It also provides three special services — the International Service, the Northern Service, and the Armed Forces Service.

16.2.4 Canadian Broadcasting Corporation

Programming. The program schedules of the CBC are varied, with both light and serious material for a wide range of public tastes. They include news and commentary, documentaries, discussion and interview, music, drama, comedy, science, religion, agriculture, school and youth programming, community services and special events, sports, consumer affairs, arts and letters. CBC enterprises derived from program material include selected program texts in book form, audio tapes of radio talks and documentaries, recordings of Canadian music and poetry and, in the French service particularly, a variety of books, records and games for young children.

Canadian content in the 1972 television schedules was not as high as expected because of interrupted production during the labour dispute with the National Association of Broadcast Employees and Technicians, but in general it was still well above the 60% required by CRTC regulations. The number of Canadian artists and performers engaged for CBC programs was close to 30,000, at fees totalling \$23 million. The major part of the CBC's television programming, on both English and French networks, was in colour. The Corporation set up an internal study group, with management and production representatives, to forecast the changing television environment over the next ten years and to make recommendations regarding the particular role of the CBC.

During 1971-72, the CBC conducted an experiment in assisting small remote communities served only by LPRTs (unmanned network relay transmitters) to operate their own local radio services. A CBC broadcaster moved with his family to a town in northern Ontario for several months, set up a small studio facility and helped to organize and train a representative group of local residents who eventually took over the planning and production of all local material. Further experiments are planned, using slightly different technical facilities, with the hope that other LPRT communities can be encouraged to add local input to the service they receive from the CBC network.

Facilities and coverage. In 1972 the total length of CBC radio networks was 29,400 miles, and of CBC television networks 11,627 miles. About 98.7% of Canadians can receive CBC radio and 97.3% CBC television, but there still remain about 300 small pockets of 500 population or more where residents do not yet have service in their own language or in some cases have no service at all. An accelerated program to reach these unserved areas, as well as an over-all CBC coverage plan, is being developed in consultation with the Department of the Secretary of State, Treasury Board, the Department of Communications and the Canadian Radio-Television Commission.

Maison de Radio-Canada, the new Montreal headquarters for the CBC's French networks, began operation during 1972; it houses one of the largest broadcast centres in the world. A construction contract was signed for a new regional centre in Vancouver to consolidate CBC facilities there by about 1975. The site for a future Toronto consolidation was acquired by CBC through a land exchange agreement with Canadian National Railways.

ANIK I, the communications satellite of Telesat Canada, was launched from Cape Kennedy on November 9, 1972. The CBC will be among the users, leasing three of the satellite's ten channels and a number of earth stations across the country. The immediate advantage, starting in 1973, will be to provide live national television service to 25 northern communities previously served only by taped and delayed programming. Gradually increased use of the satellite will also make it possible to extend CBC French services across the country, to improve certain aspects of radio distribution, and to increase regional participation in network programming, especially in the area of news and current events.

Special services. Radio Canada International (RCI), the shortwave service of the CBC, broadcasts in 11 languages to Eastern and Western Europe, Africa, Latin America, the South Pacific, the Caribbean and the United States. Five new 250-kw transmitters have been installed since 1971 and work is continuing on antenna modifications to derive the full benefit from these new facilities, which are designed to provide a stronger signal to Europe and also to permit greater flexibility in shortwave service to North America. Among its 1972 projects RCI undertook a study of the feasibility of a broadcast service to Asia. The first broadcast to originate from the new Maison de Radio-Canada in Montreal was an RCI transmission on June 19, 1972. Radio Canada International also distributes Canadian music and spoken-word recordings to broadcasters in other countries.

The CBC continued its active participation in international broadcasting organizations such as the *Communauté des télévisions francophones*, the European Broadcasting Union, the Commonwealth Broadcasting Conference and the Asian Broadcasting Union. CBC programs were sold or exchanged in a variety of foreign countries: France, Switzerland, Britain, Japan, Federal Republic of Germany, Belgium, Sweden, the Netherlands, Finland, Italy, Poland, Hungary and the United States. In radio, special plans were announced for co-operation between CBC and National Public Radio, an association of non-commercial stations in the US.

The CBC Northern Service provides medium- and short-wave radio, and some taped and delayed television, to the people of the Far North. The radio services include both national and local broadcasts, with programs in Eskimo and Indian languages as well as in English and French. Northern radio stations also contribute to the CBC's national programming. In several northern communities, delayed television will be replaced by live network service during 1973 when the Canadian domestic communications satellite ANIK I goes into regular service. The development of local television programming is expected later, as circumstances allow.

Finance. Total operating expense for the year was \$237.2 million, an increase of 8.7% over the preceding year. This figure included \$11.3 million for depreciation and amortization not recoverable from the Parliamentary payment of \$181.0 million or from the amount of \$482,000 transferred from surplus. Of the \$181.5 million represented by the Parliamentary grant and the amount transferred from surplus, an amount of \$6.6 million was required to repay the principal of previous loans, leaving \$174.9 million to cover the net cost of operations. This, together with income of \$51.0 million (mostly advertising revenue which grossed \$49.4 million) and \$11.3 million for depreciation and amortization, resulted in gross expenditure of \$237.2 million. Advertising revenues equalled 21.9% of the Corporation's expenses, excluding depreciation and amortization.

16.2.5 Statistics of the broadcasting industry

Financial and other statistics of the radio and television broadcasting industry are obtained by Statistics Canada in co-operation with the Canadian Radio-Television Commission.

In 1971, 341 private radio stations and 64 television stations furnished reports to Statistics Canada. Operating revenue of the broadcasting industry for the year amounted to \$277.7 million, an increase of 5.4% over 1970. Of the total, radio accounted for \$127.7 million or 46.0% and television for \$150.0 million or 54.0%; in 1970, radio received \$116.4 million or 44.2% and television \$146.9 million or 55.8%. Revenue from national and network time sales represented 59.0% of the total broadcasting revenue and revenue from local time sales 41.0%; national and network time sales increased by 4.4%, local time sales by 12.1% and other incidental operating revenue decreased by 20.0% from 1970. Operating expenses in 1971 at \$433.2 million were 9.1% higher than in 1970. However, total operating revenue, including Parliamentary grants provided to the CBC, exceeded these expenses, resulting in a net operating profit of \$30.1

million for 1971, a 2.3% decrease from the net operating profit of \$30.8 million earned in 1970.

In 1971, there were 19,789 employees engaged in the broadcasting industry, an increase of 213 or 1.1% over 1970. Salaries and wages paid by the industry totalled \$189.5 million, an increase of \$17.7 million or 10.3% over 1970. Fringe benefits, including such expenses as staff pensions and hospitalization insurance, totalled \$11.4 million, a rise of 8.9% from 1970. After adjustment on account of other income and expenses and income taxes, the final net profit of the private sector of the broadcasting industry in 1971 was \$28.2 million compared with \$13.8 million in 1970.

Statistics of the cable television industry. Table 16.7 presents financial statistics of an annual series dealing with the Canadian cable television industry. This industry, comprising 326 operating systems, reported an increase of 23% in total operating revenue for the year ended August 31, 1971, rising to \$66.6 million from \$54.9 million for the previous year. Subscription revenue from individual subscribers and multi-outlet contracts accounted for \$62.8 million or 94.3% of the total. Operating expenses rose from \$30.3 million (adjusted to exclude interest and depreciation for purposes of comparability) to \$35.2 million in 1971, resulting in an operating profit of \$31.4 million compared with one of \$24.7 million in the previous year. After deducting interest, depreciation and provision for income taxes, the industry achieved a net profit to August 31, 1971 of \$6.6 million compared with \$5.0 million earned in the previous year.

16.3 Federal film agencies

16.3.1 National Film Board

The National Film Board, an agency of the federal government, was established by Act of Parliament in 1939 and reconstituted by the National Film Act in 1950 "to initiate and promote the production and distribution of films in the national interest". The Board's films are produced in Canada's two official languages and have made a considerable contribution to the country's culture and to the national identity. In addition to 35mm and 16mm films, the Board produces and distributes other visual aids material — filmstrips, 8mm loop films, slide sets, overhead projectuals, multi-media kits and photo stories.

The growing sophistication of film audiences and the increasing importance of film as a means of communication are reflected in the nature of the films produced — features, documentaries, informational films, films for the specific needs of government departments, and films designed for particular social purposes. The Board strives to serve as innovator of new cinema techniques, as well as a recorder of the nation's day-to-day evolution. Thus, new needs and greater public sensitivity have encouraged the Board's film-makers to explore new film styles and to experiment in new areas of film production, and there have been corresponding new departures in the distribution and use of films as more people turn to films as a matter of course for information and assistance in many activities.

In Canada, the Board's productions are distributed through community outlets, schools and universities, television stations, theatres and commercial sales. In all these areas annual figures show a steady and, in some instances, a marked increase. A large part of the 16mm community film audience is reached through film libraries, film councils and special-interest groups. The growing demand for films can be attributed to the wide range of subject matter available; the Board's catalogue lists 60 main and sub-categories. Original films are shown regularly over English- and French-language television networks in Canada as well as in theatres.

The scope of activity in Canada continues to grow with approximately 12,000 theatrical bookings in 1972, along with 5,369 telecasts of NFB films, and three quarters of a million screenings of films borrowed from NFB regional libraries. Sales of audio-visual educational aids including filmstrips, slide sets, 8mm loops, etc., numbered 67,820.

NFB film distribution outside Canada also continues to increase. The Board's films are seen at most of the world's international film festivals with gratifying response from judges, film critics and audiences. Film distribution abroad is promoted by the Board's offices in New York, London, Paris, Buenos Aires, New Delhi and Tokyo, and by posts of the Departments of External Affairs and of Industry, Trade and Commerce. NFB films are shown in theatres of more than 100 countries and the aggregate audience of films loaned by the Department of External Affairs in about 80 countries in 1972 was in excess of 70 million people. To increase the usefulness of films about Canada abroad, the Board makes foreign-language versions of

some films in many languages, and language versions are also made under contract with television networks and school film distributors in other countries. The Board co-operates with the Canadian Government Travel Bureau to distribute films in support of the Canadian travel industry to appropriate audiences in the United States, Europe and other areas. The total audience for Canadian travel films shown abroad in 1972 was close to 13 million, of whom 12 million were in the United States.

16.3.2 Canadian Film Development Corporation

The Canadian Film Development Corporation was established in March 1967 to promote the development of a feature film industry in Canada, and in so doing it co-operates with federal and provincial departments and agencies with similar interests. It invests in Canadian productions in return for a share of the profits, makes loans to producers and assists in the distribution of feature films. The Corporation also makes awards for outstanding accomplishments in production and makes grants to film-makers and technicians for further study.

Since its inception, investments in Canadian feature films assisted by the Corporation have increased from \$12 million to \$17.7 million; investment by the Corporation has increased to \$6.7 million, private Canadian investors contributed \$7.3 million and the balance came from outside Canada, mainly from major US film companies. Of the \$17.7 million, \$4.2 million went to Canadian laboratories and technical services and \$4.0 million to film-makers and other creative contributors, resulting in creation of 1,574 engagements for performers, 791 jobs for technicians and about 360 other jobs. A total of 83 films, 42 in English and 41 in French, have been completed or are in process of production. By the end of 1971-72, 34 of the 64 Corporation-backed feature films were in distribution, representing a total Corporation investment of \$3.4 million. To date, the cumulative return has been \$600,000; three of the films have recovered their full production costs and reached profit positions. However, the amount recovered in 1971-72 was \$99,500 less than in the previous year, due in part to new films placed in distribution being less well received by Canadian audiences and to a continuing decline in movie attendance.

Nine Canadian distribution companies invested in Canadian feature films in 1971-72, and several recently released feature films produced with Corporation assistance have received favourable reviews from both Canadian and international film critics.

Canadian participation in film festivals and other special showings in 1971-72, organized by the Corporation in collaboration with the National Film Board, the Departments of Industry, Trade and Commerce, Secretary of State and External Affairs and Information Canada — Expositions Division, resulted in excellent promotion for the Canadian feature film industry. At the Cannes Film Festival 16 feature films, most of which had Corporation backing, were screened to potential buyers, with moderate success in obtaining sales to foreign distributors. One film, *Fortune and men's eyes*, was chosen to represent Canada at film festivals in Venice and Belgrade. At the *Xe Journées cinématographiques de Poitiers*, a major cultural event held annually in France, Canada was the featured country; nine of the 25 Canadian films shown were produced with the help of the Corporation, the remainder coming from private industry. Eleven film productions from Quebec, four of which were assisted by the Corporation, were featured during Film Week at the Museum of Modern Art in New York City in February.

During 1971-72, the Corporation approved grants to groups and individuals totalling \$70,000. Four \$7,500 grants and five \$4,000 grants were made to aspiring film-makers on the west coast, six grants of \$1,250 to \$2,000 to similar applicants in Toronto, and \$10,000 was granted to the *Association coopérative de productions audio-visuelles* in Montreal as the balance of a \$50,000 grant awarded in the previous year.

16.4 Postal service

The basic function of the Canadian Postal Service is to receive, convey and deliver postal matter with speed and security. To do this, it maintains thousands of post offices and utilizes air, rail, road and water transportation facilities. Associated functions include: sales of stamps and other articles of postage, registration of letters and other mail for dispatch, insuring parcels, accounting for COD articles and transaction of money-order business. Also, because of its transcontinental facilities, the Post Office assists other government departments with such tasks as selling hunting permits, collecting government annuity payments, distributing

income tax forms and Public Service employment application forms, and displaying government posters.

Post offices are established wherever the population warrants. Those in rural areas and small urban centres transact all the functions of a city office. In larger urban areas, postal stations have full functions similar to the main post office, including general delivery service, lock-box delivery and letter-carrier delivery. Canada's larger post offices are complex semi-automated plants with conveyors and chutes, parcel and bag sorting machines, wrapomatic parcel sealing machines, photo-electric counters, intercom systems and observation gallery telephone systems. Outside the post office building there are mail-mobiles, automatic stamp-vending machines and curbside mail boxes.

The operating service of the Post Office Department is organized into four regions, each headed by a general manager reporting directly to the Deputy Postmaster General. The regions are further divided into districts, each headed by a district director. The operating and support functions required in the provision of postal service to the public are the responsibility of the local postmasters who receive technical and administrative assistance from district and regional offices at strategic points.

Postal service is provided throughout Canada. Canada's airmail system utilizes most transcontinental flights, supported by many branch and connecting lines, and links up with United States domestic and other international airmail systems. First-class domestic mail is carried by air between Canadian points whenever this would expedite delivery. Air stage routes provide an all-class mail service to many northern areas which can be served only by air. There are over 46,000 miles of airmail and air stage routes.

The Assured Mail Program guaranteeing next-delivery-day service of first-class letters if mailed early in the day, launched in Toronto in 1971, was extended to all major Canadian cities in 1972. By 1974 the country will be completely coded with postal coding machines operating in major centres; coding machinery is already in operation at the main Ottawa postal station.

At March 31, 1972, there were 8,564 post offices in operation; letter-carrier delivery was being provided in 254 urban areas and 5,093 private contractors were delivering mail to 798,727 rural and suburban households. In 1972, 504 city mail services transported mail between post offices and postal stations, collected mail from street letter boxes and delivered parcel post, and 439 side services transported mail between post offices and railway stations, wharves and airports. Intercity transportation of mail by highway motor vehicle was conducted by 659 major services, complemented by 846 feeder or stage services operating to and from smaller centres. Although many of the highway services have replaced rail for the transportation of mail, rail remained the principal mode for long distance movements of other than first-class matter.

Revenue and expenditure of the Post Office Department for the year ended March 31, 1972 were \$504.2 million and \$581.2 million, respectively: gross revenue receipts are received mainly from postage, either in the form of postage stamps and stamped stationery, postage meter and postage register machine impressions, or in cash. During the year, 43.8 million money orders were issued having a value of \$1,011 million, of which \$983.1 million was payable in Canada and \$27.8 million in other countries. The value of money orders issued in other countries and payable in Canada was \$8.7 million.

16.5 The press

Daily newspapers published in Canada in 1972 numbered 119, counting morning and evening editions separately. Combined circulation was about 4.7 million – 82% in English and 18% in French (Table 16.8). Publishers' surveys show that each newspaper is read by an average of three persons.

Daily newspaper advertising revenue in 1971 was \$327.9 million and circulation revenue was \$120.3 million. By comparison, advertising revenue of 341 private radio stations in Canada in 1971 was \$122.7 million and of 64 private television stations \$104.6 million. In 1972, there were 14 daily newspapers with a circulation in excess of 100,000, accounting for 55% of total circulation. There were 12 dailies published in the French language, ten of them located in Quebec. Although the circulation of daily newspapers blankets the more populous areas well beyond publishing points, smaller cities and towns and rural areas are also served by 825 weekly newspapers catering to local interests and exercising important local influence. The

Canadian society is also enriched by 87 foreign-language daily or weekly newspapers published in 27 languages, often sprinkled with English.

About 57% of Canada's daily newspapers are privately owned or independent. There are three major newspaper chains in the country, owned by Southam Press Ltd. (14 dailies), Thomson Newspapers Ltd. (31 dailies) and FP Publications Ltd. (six dailies). Both Southam and Thomson Newspapers are publicly owned companies with shares traded on Canadian stock exchanges. Papers in the Thomson chain are concentrated in the smaller cities. Southam accounts for about 25% of total daily circulation, Thomson for 10% and FP for about 7%.

In addition to their own news-gathering staffs and facilities, Canadian newspapers subscribe to a number of syndicated agencies and wire services, the largest being The Canadian Press which is a co-operative agency owned and operated by Canadian dailies. Largely by teletype and wirephoto transmission, it provides its 101 member newspapers with world and Canadian news and also serves radio and television stations. CP has its own news-gathering staff and each member newspaper provides the agency with important local news for transmission to fellow members and members share the cost in ratio to their circulations.

CP carries world news from Reuters (the British agency), from The Associated Press (the United States co-operative) and from Agence France-Presse (of France) and these agencies receive CP news on a reciprocal basis. CP maintains a French-language service in Quebec.

United Press International of Canada, the second major news wire service in Canada, is a private company and a part of United Press International World Service. It provides Canadian and international news and pictures to newspapers and TV and radio stations across Canada and is an outlet for Canadian news through United Press International facilities throughout the world. Certain foreign newspapers maintain bureaus in Ottawa and elsewhere in Canada to collect and interpret Canadian news.

Press statistics. Table 16.8 gives numbers and circulations of reporting English-, French- and foreign-language newspapers, by province, for 1971 and 1972, estimated from *Canadian Advertising*. Circulation figures are given for daily English- and French-language newspapers only. Such circulation figures are relatively easy to obtain because, in their own interest, newspapers qualify for and subscribe to the Audit Bureau of Circulation. For these, ABC "Net paid" figures have been used; "controlled" (free) distribution newspapers are not included. On the other hand, circulation data for foreign-language newspapers, weekly newspapers, weekend newspapers and magazines are incomplete and therefore not usable.

In 1972, 43 of the 101 daily newspapers and 33 of the 656 weeklies in the English language were published in centres of 50,000 population and over. French-language newspapers in centres of the same size numbered ten dailies of the total of 12, and 47 of the 169 weeklies, more than half of which were bilingual.

Publications in 27 foreign languages in 1972 numbered 116, compared with 111 in the previous year. Of these, 20 were in Ukrainian, 16 in Italian, ten in German, eight in Hungarian; the Dutch and Portuguese languages accounted for seven each, Greek for six, Chinese five and Yiddish four.

Magazines and related publications totalled an estimated 912 in 1972, of which 200 were classed as trade, industry and related publications, 157 as educational, 98 as services and directories, 86 as sports and entertainment, 64 as agricultural and rural; home, social and welfare publications and pharmaceutical, medical, dental and nursing publications each accounted for 61, and transportation and travel for 50.

Chapter 17

Manufacturing and merchandising

17.1 Manufacturing industries

Statistics on the manufacturing industries are issued by Statistics Canada on an annual, monthly and quarterly basis, depending on the type of data. The annual Census of Manufactures provides the basic annual data. Among the monthly figures available, two important types of information lend themselves to projecting figures of the annual Census of Manufactures: the survey of manufacturers' shipments, inventories and orders, and surveys of employment and related information.

The monthly shipments, inventories and orders series is published by manufacturing industry for Canada and the provinces, with breakdowns by industry group and by selected industry in the case of the totals for Canada. The data are derived from a survey of respondents to the annual census and are projections of the census total, subject to the qualification that only significant new entries into the manufacturing industries since the latest census are added.

The most comprehensive figures resulting from monthly surveys of employment have been estimates of the total number of employees in the manufacturing industries of Canada and the provinces, classified into durable and non-durable goods industries, but publication of these figures has been temporarily halted pending modification of the survey. Both the monthly shipments survey and monthly estimates of employment are based partly on statistical sampling. Both sets of monthly figures also yield totals for the calendar year; while the annual census includes some reports made on a respondent's fiscal year differing from the calendar year, the effect of this is not large.

The data obtained relate to establishments — roughly corresponding to the popular conception of a plant, factory or mill — and, for certain statistics, to non-manufacturing units known as "head offices, sales offices and auxiliary units". For some purposes, companies rather than plants or factories are of interest. For example, a company owning factories, mines and merchandising outlets will normally report its profit for the whole company rather than divide it among the different industrial activities in which it is engaged. Thus, the quarterly survey of corporation profits provides figures on sales, profits and certain other statistics for whole companies classified to industries on the basis of their principal activities (for instance, factories might be included in mining or mines in the manufacturing industry). Such figures are generally not comparable with establishment statistics.

Various other monthly and quarterly surveys relate to commodities rather than to establishments or companies. That is, they account for production or shipments of particular products without regard to the industry in which they are produced.

In addition to providing estimates of over-all employment in manufacturing (and other industries), monthly surveying of employment, hours and payrolls results in indexes of employment for larger establishments by industry and by province and sub-provincial area, and in data on average hours and earnings. Monthly indexes of industrial production provide measures of the physical volume of output of the manufacturing industries. That is, they measure output, net of the effects of price changes. These indexes afford annual averages which can be used to indicate movement in the real domestic product at factor cost originating in the manufacturing industries. In addition, many users find valuable information in the large number of monthly industry selling price indexes for various manufacturing industries.

17.1.1 Post-census data

Only preliminary data based on monthly or quarterly surveys are available for 1971 and 1972 as the results of the Census of Manufactures were being processed at the time of writing. Some factors influencing the levels of current and annual census figures in comparison with each other are mentioned in the preceding text.

Table 17.1 compares the value of shipments of goods of own manufacture, by province, for 1972 (from a monthly survey) with data for 1970 and earlier censuses, and Table 17.2 makes similar comparisons for industry groups. Table 17.3 gives company data on profitability in various industry groups for the years 1964-72. Because these latter figures relate to companies

and those derived from the Census of Manufactures relate to establishments (roughly speaking, plants), the two series are of only limited comparability.

17.1.2 Census of Manufactures

Results of the Census of Manufactures are published industry by industry as they become available. The census of 1970 was the latest for which all industries had been issued at the time this Chapter was prepared. Summary statistics are given in Tables 17.4 - 17.9.

Introduction of the 1970 revision of the Standard Industrial Classification substantially affected comparability of data for many industries compiled on the new basis with data for 1969 and earlier years. To assess the effects of classification changes on the same year's data and to provide data comparable with earlier years, the results of the 1970 Census were calculated according to both the 1970 and the 1960 revisions of the Standard Industrial Classification (SIC). In Table 17.5 the industry groups of the 1960 revision of the SIC have been used for 1970 as well as 1969 data, while in Table 17.9 the 1970 data alone are presented according to the 1970 revision.

Revision of the SIC did not affect the allocation of activity between manufacturing and other divisions of the classification and totals for all manufacturing industries as a whole are the same under either version. In this Chapter the basis of calculation of all 1970 data is the 1970 revision unless comparison with earlier years is involved.

Central Canada accounted for about four out of every five dollars of all value added by manufacture in the manufacturing industries of Canada in both 1969 and 1970; Ontario's contribution in 1970 was 52.5% and Quebec's 28.9%. British Columbia was in third place, accounting for some 8.1% of value added by manufacture. Alberta, Saskatchewan and Manitoba combined were almost as large a contributor, accounting for 6.9%, the Atlantic Provinces accounting for 3.6%.

An effective measure of the intensity of manufacturing activity by region is in terms of value added per capita of their population. The 1970 Canada average was \$938; Quebec and British Columbia were both close to this average with \$964 and \$757, respectively, but Ontario's average was much higher at \$1,378. The average for the Prairie Provinces was \$392 and that for the Atlantic Provinces, \$358.

17.1.3 Size of manufacturing establishments

The average size of a manufacturing establishment, in terms of numbers of persons employed, is somewhat over 50 persons but more than one half of the total work force in the manufacturing industries is in establishments employing 200 or more persons. While almost one third of the manufacturing establishments in Canada have fewer than five persons employed, including working owners, these establishments, because of their small average size, account for only about one in 75 persons of the working force of the manufacturing industries (Tables 17.10 - 17.12).

The average size of a manufacturing establishment in terms of shipments of goods of own manufacture was \$1.5 million in 1970 (Table 17.13). However, this average size is greatly affected by the large number of very small establishments which in fact account for only a minor share of over-all shipments. Establishments with \$1 million or more shipments of goods of own manufacture in 1970 accounted for about one establishment in five in the manufacturing industries, but they reported 88.8% of the total value of shipments of goods of own manufacture (Tables 17.14 - 17.15).

17.1.4 Exports of manufactured goods

Export statistics are not broken down into manufactured goods and other goods but the categories "fabricated materials" and "end products" give some indication of the degree of manufacture of such exports and the total for the two can be used as a substitute for manufactured exports. Because exports are not necessarily made by the manufacturer and because of valuation problems, the resulting series are not wholly comparable with Census of Manufactures data on manufacturer's shipments of goods of own manufacture. In the latter, for instance, work by smelters owned by mining companies is valued at an imputed charge to the mine, not at the value of the metal produced. Table 17.16 shows recent trends in exports of manufactures.

An important reason for the rising level of exports in the end products category has been the Canada - United States Agreement on Automotive Products, which went into effect in 1965.

17.2 The importance of large enterprises

Large businesses play an important role in the economy of a modern industrial state. Just how important a role this is may be measured by specially compiled statistics. Figures from Statistics Canada's first official report *Industrial organization and concentration in the manufacturing, mining and logging industries, 1968* are presented in this Chapter. The report contains other concentration measures for 1968 and comparable statistics for the 1965 data year of the Census of Industry. Concentration measures were published for 1965 by the Department of Consumer and Corporate Affairs, based on compilations prepared by Statistics Canada, covering 154 industries. A slightly different type of concentration study for 1948, also based upon Census of Industry data, was published by Princeton University in 1957. The 1968 report is, however, the first to cover all Canadian manufacturing industries with the exception of one small miscellaneous classification.

This method of organizing statistics of "industrial concentration" consists of expressing the share of the shipments of an industry accounted for by the largest four, eight and twelve, etc., enterprises as a percentage of the total for the industry, with further similar measures for other numbers of leading enterprises.

Compiled for all Canadian manufacturing for 1968, figures show that the largest four enterprises within the manufacturing industries (ranked by manufacturing value added) accounted for 7.7% of all manufacturing value added and 10.0% of all manufacturing shipments. The largest eight enterprises accounted for 12.1% and 14.0%, respectively.

Similar comparisons are available for individual industries on the basis of various numbers of leading enterprises as defined by their shipments. The most commonly cited statistic is the percentage of the industry's shipments accounted for by the four largest enterprises. For example, in Canada's largest manufacturing industry measured by shipments, motor vehicle manufacturers, the four largest enterprises accounted for 94.6% of all manufacturing shipments in 1968. This share of industry shipments, commonly referred to as a "concentration ratio" even though expressed as a percentage, shows motor vehicle manufacturing to be highly concentrated. An example of an industry with low concentration would be women's clothing factories, where the largest four enterprises accounted for only 7.7% of shipments in 1968. A weighted average of the concentration ratios for the top four enterprises in all manufacturing industries was 47.8%.

Some concentration ratios for the 40 leading industries of Canada — defined as those having the largest manufacturing shipments — are given in Table 17.17. The degree of concentration in industries in various industry groups is shown in Table 17.18, while in Table 17.19 some data are presented for the largest four, and succeeding groups of four enterprises operating in all manufacturing industries considered together. An enterprise consists of companies under common ownership or control. In this study, one company is treated as being controlled by another if the parent firm owns more than 50% of the voting stock. Most enterprises in fact consist of only one company and most of these have only one establishment, but some enterprises, especially in certain industries, have many companies and establishments.

As an example, the Aluminum Company of Canada (Alcan) had 22 establishments in nine industries of the 1968 Census of Industry, operated through nine companies or corporate entities. Two of these establishments were in the mining industry and are not included in any tables presented with this article. Table 17.19, showing aggregate concentration in the manufacturing industries, includes the 20 manufacturing establishments of the Aluminum Company of Canada added together and treated as one enterprise, and ranked according to the aggregate value added of these 20 establishments. In the data for the smelting and refining industry, only the five Alcan establishments in that industry are included before ranking enterprises by their shipments (in this industry production rather than shipments is used and integrated smelters' output is measured as an imputed custom charge to the mining industry). In the aluminum rolling, casting and extruding industry, six establishments or plants owned by four Alcan companies in that industry are treated as the operations of one enterprise.

Purpose of concentration statistics. Concentration in industry is generally acknowledged to be a most important economic phenomenon, although the precise significance of high concentration for various aspects of the behaviour of enterprises is still to some extent a matter of difference of opinion among specialists in this field. Economists use concentration measures for studying the competitiveness of industries and the effect of industry concentration on

company decisions regarding research, advertising expenditure, labour union negotiations, pricing policy, etc. For some of these purposes concentration measures must be derived from returns for companies rather than establishments or plants; the present statistics are calculated from returns for establishments or plants, making it possible to divide a company up among the various industries in which it is active.

Concentration statistics are particularly valuable when available for a period of years. Comparisons show fluctuations in the levels of concentration in an industry and may indicate if the changes are in response to the growth of the industry or whether the degree of change in concentration as distinct from the actual level of concentration can be explained by a particular cause or is affected by the behaviour of firms. Thus, concentration measures can be used to study changes in concentration within an industry over time, as well as to compare concentration at a point in time between different industries and, where possible, between the same industries in different countries. Concentration measures are now available for a number of industrialized countries though differing industrial classifications may affect international comparisons.

The interpretation of concentration measures are subject to certain limitations. Their purpose is to measure the extent to which a small number of large firms dominate the market, but when data for whole plants are added to give industry shipments a very mixed assortment of products may be involved. Often some products will be included which are really typical of other industries. For some purposes it would be better to calculate concentration ratios for shipments of particular products or product groups, regardless of the classification of the industries of the particular plants producing them. In either case, there is room for difference of opinion on what grouping of industries or products is appropriate. For example, pork and beef are sold in competition with each other, thus concentration for the two combined or for the slaughtering and meat processors industry as a whole may be preferable to concentration for either by itself. On the other hand, concentration of shipments of large electric motors may be preferable for some purposes to concentration of shipments of an entire industry such as manufacturers of electrical industrial equipment. For other purposes, the industry may be the better basis of measurement since, in competing, producers may be able to shift capacity between products. Concentration ratios for product classes are expected in due course.

Imports and exports modify the meaningfulness of industry shipments as a measure of a market. The top four enterprises in the pulp and paper industry account for 33.7% of shipments but this does not give direct information on concentration in a definite geographic market since most shipments are exported. However, capacity may be potentially available to the domestic market. In the case of motor vehicle manufacturers, the 94.8% share of the top four firms in shipments masks the effect of both imports and exports of motor vehicles but it does show that the manufacture of motor vehicles is a highly concentrated activity.

For many industries or products, markets are regional or even local. The national concentration ratio for an industry like bakeries, showing 30.7% of shipments accounted for by the leading four firms, does not take this into account as concentration may vary in different markets.

The meaning of concentration is also modified in Canada by the existence of strong international enterprises. This means that the ability of an enterprise to compete in the Canadian market may be influenced to an important degree by the size of the foreign parent as well as the relative size of the Canadian subsidiary. Concentration measures, of course, do not take this into account. However, for many industries covered by concentration statistics, the percentage of shipments accounted for by leading producers will no doubt be a useful indicator of competitive conditions, particularly when a series of such indicators becomes available for several years.

Causes of concentration. The economic causes of concentration are diverse. It is likely that some industries are highly concentrated in a country like Canada simply because the market is small in relation to the minimum economic size of plant. In some industries, marketing may be difficult for small companies because of a need for a well developed network of dealers, while room exists for only a few such extensive networks. High costs of advertising and marketing may restrict the number of sellers and leave the industry's largest firms in a favoured position; this is particularly true of the consumer goods industries where individual consumers may be highly subject to the influence of advertising and of real or imagined differences between particular brands. In some national economies, the development of distinctive products

Concentration by industry,
top four enterprises, 1968

through research possibly favours concentration, although it could also have the opposite effect. In some countries, there may be actual artificial restriction of competition and entry by collusive agreements and predatory practices, legal or illegal. In Canada, the degree of concentration in many industries may be influenced by the existence of large multinational corporations; however, the effect in any individual industry would require considerable study as these foreign-owned enterprises may actually lower concentration in cases where the determination of a large foreign company to be represented in Canada may make for more medium-sized producers.

Location near markets or materials may make for relatively low concentration in an industry when the largest producers are characterized by extensive networks of plants. Examples of industries with geographical diversification and relatively low concentration, by comparison with other industries, are dairies, sawmills or ready-mix concrete manufacturers. There may be high concentration locally or regionally with transportability of the product influencing the impact on competition. A widely dispersed industry which is highly concentrated is breweries.

In an industry with a small number of plants, the top four firms will have a considerable proportion of the plants even if they have only one plant each. Thus in the motor vehicle industry, which has 21 establishments, the top four firms would have to have at least 19% of the establishments. This in turn sets the minimum possible proportion they could have of the industry's shipments, even if the top four firms had only one establishment, each only minimally above the industry's average size of establishment. But the top four firms in fact have six establishments or approximately 29% of the establishments and these are considerably above average size. The way in which the concentration in any particular industry arises can be analyzed in a similar fashion but this will not necessarily show the cause of the concentration. In some industries the leading firms may have a considerable share of the establishments as a result of appropriating a large share of the market. Establishment concentration and the relative size of the large firms' plants are "components" of the industry's shipments concentration.

Concentration in the 40 leading industries. It is not proposed to examine here the characteristics of industries generally in relation to concentration in 1968. However, some features of the more concentrated and less concentrated industries among the 40 industries with the largest value of shipments may be of interest. The concentration ratios for these industries in Table 17.17 may be compared with actual principal statistics for the same industries in Table 17.6. These industries account for 69% of 1968 shipments of the manufacturing industries.

Although chosen for their shipments size, the 40 industries have been ranked in descending order of the percentage share of the top four firms in each industry's shipments. The number of enterprises, establishments and certain measures of concentration are shown. (One industry had to be omitted because its concentration ratios for the top four firms are confidential under the Statistics Act.)

A striking feature of the 20 more concentrated industries among the 40 is that only three are not also among the top 20 industries in Canada in terms of manufacturing shipments. That is, they are larger industries than the less concentrated 20 industries, in terms of shipments. Equally noticeable is that the 20 more concentrated industries are much smaller than the 20 less concentrated industries in terms of total numbers of establishments. The 20 more concentrated industries together had only 2,244 establishments, compared with 15,457 establishments for the 20 less concentrated industries, although, as noted, the latter were smaller industries in terms of shipments. In other words, the more concentrated of the 40 industries were large industries with much larger average size of establishment.

A feature of the less concentrated of these industries which is perhaps surprising until considered more closely is that multi-plant operations are more characteristic of them than of the more concentrated 20 industries, measured by establishments per enterprise for the industry or for the leading four firms. While this spread is not large, its existence is due to the fact that the less concentrated industries include many which are widely spread geographically, so that firm growth has to be expressed in the building or acquisition of additional plants. The average number of plants per firm for the top four firms equalled or exceeded five in ten out of 20 of the less concentrated of the 40 industries, rising as high as 15.8 for feed manufacturers and 13.5 for bakeries and dairies. Only five of the 20 more concentrated industries had five or more plants per firm for the top four firms, although these again were mostly geographically diversified industries, soft drink manufacturers with 10.3 per firm being the highest.

In spite of fewer plants per firm in the top four firms relative to the group of unconcentrated industries, the more concentrated industries were nevertheless characterized by higher establishment concentration. The total numbers of establishments in the more concentrated industries being relatively small, the multi-plant operations of the leading firms tend to account for a larger percentage of the industry's establishments, even though the multi-plant activity of leading firms is somewhat less marked than in the less concentrated 20 industries.

In summary, the more concentrated of the 40 industries could be said to be large industries with few establishments, high average shipments per establishment and somewhat less multi-plant activity by leading firms than the less concentrated industries in the group. The ratio of average plant size for the leading firms to the industry's average plant size tends to be influenced by the fact that in extremely concentrated industries the leading firms themselves

largely determine the industry's average plant size. However, among all 40 industries the leading four firms have much larger than industry-average plant size and this plays an important role in the degree of concentration.

17.3 Government assistance to manufacturing

17.3.1 Federal assistance

The Department of Industry, Trade and Commerce is responsible for stimulating the establishment, growth and efficiency of the manufacturing, processing and tourist industries in Canada, and also for developing export trade and external trade policies. It assists Canadian industries to initiate and take advantage of technological advances, improve products and services, increase productivity and expand domestic and foreign markets through a wide variety of programs and services. At each phase of the product cycle — from research, development and design through production and marketing — the Department can assist with information and financial assistance.

Program for the Advancement of Industrial Technology (PAIT). The objective of PAIT is to promote the growth and efficiency of industry in Canada by providing financial assistance for selected projects concerned with the development of new or improved products and processes incorporating advanced technology, which offer good prospects for commercial exploitation in domestic and international markets. The program, initiated in 1965, was revised in 1970 to provide cash grants in lieu of loans, and has been expanded to include assistance for some specific activities outside of the development phase.

Financial assistance, normally 50% of the development costs and certain eligible preproduction and marketing expenses, is available to companies incorporated in Canada for projects to be carried out in Canada. Title to any invention or patent is vested in and remains the property of the company. Companies are expected to have the capabilities and facilities to undertake the development work and also to provide for the manufacture and sale of the resulting products. Further details are given in Chapter 9, Section 9.2.6.

Industrial Research and Development Incentives Act. This legislation, enacted in March 1967, provides cash grants or equivalent tax credits equal to 25% of capital expenditures of corporations for scientific research and development conducted in Canada, and for the increase in current expenditures in Canada for scientific research and development over the average of such expenditures in the preceding five years. To qualify for a grant, expenditures must be for scientific research and development which, if successful, is likely to lead to an extension of the business of the corporation. In addition, a corporation must undertake to exploit the results of the research and development in Canada and must normally be free to export products resulting from such research and development to all countries of the world (see also Chapter 9, Section 9.2.6).

Automotive Program. The Canada - United States Agreement on Automotive Products, signed in January 1965, provides for the removal of tariffs and other impediments to trade between the two countries in motor vehicles and original equipment parts. The basic objectives of the Agreement are: creation of a broader market to permit benefits of specialization and scale; trade liberalization to enable both countries to participate in the North American market on a fair and equitable basis; and development of conditions in which market forces would operate to attain economic patterns of investment, production and trade.

As a result of this program, Canada is now producing an increasingly larger share of the total North American output of vehicles and components. Canadian exports of vehicles and parts and employment in this industry have increased substantially, and investment in new plants and expansion of existing facilities have been extensive.

The Machinery Program was introduced on January 1, 1968 to increase efficiency in Canadian industry by enabling machinery users to acquire advanced capital equipment at the lowest possible cost while affording Canadian machinery producers tariff protection on what they manufacture. At the same time, Canadian machinery producers are protected by a single statutory rate of duty which applies immediately when they are in a position to supply. This is particularly significant for Canadian producers of custom-engineered machinery.

The program covers a broad range of machines classifiable under Tariff Item 42700-1 including general-purpose machinery, metalworking and woodworking machinery, construc-

tion and materials-handling equipment and various types of special industry machinery, such as pulp and paper and plastics industry machinery, and service industry equipment. The statutory rate of duty under that Tariff Item is 2½% British preferential and 15% most-favoured-nation.

The program provides that the duty otherwise payable on machines, accessories, attachments, control equipment, tools and components, imported under Tariff Item 42700-1, may be remitted if such remission is in the public interest and the goods imported are not available from production in Canada. A Machinery and Equipment Advisory Board advises the Minister of Industry, Trade and Commerce regarding the eligibility of machinery for remission of duty in accordance with the provisions of the Tariff Item. The Board, in turn, is assisted by the branches of the Department concerned with individual industries, including machinery manufacturing. Final authority for granting remission lies with the Governor in Council.

Under the program, machinery producers may also apply for remission of duty on production parts and components included in Tariff Item 42700-1 which they cannot procure in Canada. This provision is for the purpose of stimulating Canadian machinery manufacturers to specialize their production and enable them to compete more effectively.

Since June 18, 1971, the Machinery Program has been extended to imports under Tariff Item 41100-1 covering machinery for use in sawmills and logging. In the same year, the Machinery and Equipment Advisory Board took over from the Adjustment Assistance Board the responsibility for examining all tariff remission applications in respect of machinery and equipment or production tooling for the manufacture of original equipment, automotive parts and accessories.

Building Equipment, Accessories and Materials Program (BEAM) was established to help achieve greater efficiency and productivity in the manufacture and use of building equipment accessories and materials. The objectives of the program include: establishment of a comprehensive National Construction Information System; encouragement of modular dimensional standardization and co-ordination; acceleration of the industrialization of the building process; development and expansion of export markets; promotion of uniform building regulations and standards; and encouragement of building design excellence through awards programs.

The program is being implemented and is subject to further development through the Construction Industry Development Council and in co-operation with industry through the major associations. The Council, which is responsible to the Minister of Industry, Trade and Commerce, is national in scope, comprising 35 representatives of the manufacturing, design and contracting sectors of the industry as well as labour unions, universities and government. Co-operating directly in the BEAM program are the Canadian Construction Association, the Royal Architectural Institute of Canada, the Association of Consulting Engineers of Canada, the Specification Writers Association, the National Home Builders Association, and the Housing and Urban Development Association of Canada.

Having established the needs and priorities for construction information in Canada, ways in which a comprehensive and flexible information system can be developed were identified. A thesaurus of Canadian construction industry terms has been compiled in both English and French to assist in providing a means of indexing the system and to resolve the ambiguity in construction terminology. A glossary equating French and English construction industry terms has also been established.

The design and performance specifications for a National Construction Information System have been completed and work has commenced on the acquisition of data suitable to the system. To provide a commercial operations channel, a non-profit corporation known as the Canadian Construction Information Corporation has been established and is in the process of implementing the system.

The Department has continued the program to encourage the increased use of dimensional standardization and co-ordination of building components and buildings. Initially, conferences were held throughout Canada to acquaint policy-makers within the industry with the technological and economic advantages of modular standardization. These conferences continue to be followed up by a program of clinics of modular practice. In addition, a directory of modular building components is published annually.

Encouragement of greater industrialization of the building process through an understanding and application of a systems approach to building is being carried out through publications and through conferences and seminars held across Canada.

To encourage building design excellence, awards for the creative use of materials in architecture and structural engineering have been presented under the Design Awards Program. This program is sponsored by the National Design Council and the Department of Industry, Trade and Commerce in co-operation with the appropriate industry association within the framework of the BEAM program.

The promotion of universal use of the National Building Code is continuing. Manitoba has made it mandatory for all larger cities and towns. Ontario, New Brunswick, Nova Scotia and British Columbia have taken or are planning to take similar action and Quebec is studying its feasibility. A *Building standards index* lists all codes, standards and specifications used in the Canadian construction industry.

Export opportunities for the goods and services of the construction industry continue to be identified through the Department's trade posts abroad and in co-operation with industry.

Industrial design. The design program, authorized by the National Design Council Act 1961 and administered by the Department's Office of Design is aimed at promoting and expediting improvement in the products of Canadian secondary industry. The Office of Design is also responsible for developing and carrying out programs and projects pertaining to more widespread use of improved industrial design.

Design programs include: financial and technical assistance to educational institutions to introduce design training at the technical and university levels; seminars on various facets of design for the benefit of professionals, educators, business executives and the general public; awards programs for achievements over a broad field of design endeavour; scholarships for advanced training in industrial design in Canada and abroad; grants for design research and promotion by Canadians; and technical and financial assistance to committees and groups dedicated to the implementation of programs to foster effective design on a national, regional or industrial level.

Under the Industrial Design Assistance Program (IDAP) introduced in 1970, manufacturers are given financial support to develop new and improved designs by employing qualified industrial designers. The assistance is available to companies incorporated in Canada and is concentrated on relatively short-term projects of product innovation; it is limited to 50% of the projected design cost, subject to technical and commercial feasibility.

A National Design Council Chairman's Award for Design Management was introduced in 1970, to be presented to the management group which, in the Council's opinion, does the most to integrate and efficiently apply good design policy.

Defence Industry Productivity Program (combining the former Industry Modernization for Defence Exports Program and the Defence Development Sharing Program) is designed to enhance the technological competence of the Canadian defence industry in its export activities by providing financial assistance to industrial firms for selected projects. Emphasis is placed on those areas of defence technology having civil export sales potential. Assistance may cover the development of products for export purposes; the acquisition of modern machine tools and other advanced manufacturing equipment to meet exacting military standards; and assistance with preproduction expenses to establish manufacturing sources in Canada for export markets. Manufacturing equipment projects are selected for assistance on the basis that the machinery acquired will make a significant contribution to increased productivity. More details of this program may be found in Chapter 9, Section 9.2.6.

The Automotive Adjustment Assistance Program, which remains in force until June 30, 1973, offers opportunities to Canadian automotive parts manufacturers for expanded production, rationalization of output and reduced costs. In order to take advantage of these opportunities, Canadian parts makers must engage in substantial re-equipment and plant expansion programs. Term loans are made available for the financing of the acquisition, construction, installation and modernization of facilities or machinery and for use as working capital. Responsibility for the tariff remission aspects of the program was transferred to the Machinery and Equipment Advisory Board, effective June 1, 1971.

General Adjustment Assistance Program (GAAP). established in 1968 and revised in 1971, helps manufacturers take advantage of export opportunities arising from the Kennedy Round and assists manufacturers of textile or clothing goods or footwear to improve their competitive position in domestic or export markets. The program also provides assistance to manufacturers who have been injured, or are threatened with serious injury, as a result of Kennedy Round reductions of Canadian tariffs, and to manufacturers of textile or clothing goods or footwear who require financing to adapt efficiently to disruptive import competition which is threatening, or causing, serious injury. Assistance under the program is also available to firms that provide marketing, financing or other services essential to the operations of manufacturers described above.

The governing Regulations require that eligible firms for whom loan insurance or direct loans are approved be unable to acquire the financing provided by the Board or through the Board's support from conventional sources on reasonable terms and conditions.

Assistance is available in three forms: government insurance against the risk of loss on loans made by private lenders for the purpose of financing viable restructuring projects; direct government loans to eligible applicants in special cases; and grants covering up to 50% of cost to manufacturers who require outside consulting assistance to develop restructuring proposals. The program is administered by a General Adjustment Assistance Board on which both private industry and government are represented.

Ship Construction Subsidy Regulations. The Department has been responsible since 1967 for shipbuilding matters, including the Ship Construction Subsidy Regulations and certain sections of the Income Tax Act and Regulations. The industry continues to respond to the policy of national competition for government shipbuilding requirements and has made active use of the subsidy program for commercial vessels. The latter provides a subsidy rate of 17% for ships other than fishing vessels. For fishing vessels, the subsidy rate is 35%. With the support of other programs, the Department has encouraged the development of production of marine components and exports in this area have been increased. Also, assistance has been given to several shipyards to encourage modernization of shipbuilding facilities.

Shipbuilding Temporary Assistance Program (STAP). Because the demand for Canadian-flag ships has been in a temporary decline and assistance under the Ship Construction Subsidy Regulations is not applicable to foreign-flag vessels, the Shipbuilding Temporary Assistance Program was announced in November 1970 to enable Canadian shipyards to maintain their employment levels by building for the world market. STAP shipbuilding grants, paid to shipyards building for registration in countries other than Canada, were initially at 17% of approved cost (14% for very large vessels) but are now 15.5% and 12.5%, respectively. Some \$271 million of shipbuilding contracts have been obtained (to December 1972) by Canadian yards with the assistance of this program.

Pharmaceutical Industry Development Assistance (PIDA). This program was authorized by Parliament in March 1968, and is administered by the Pharmaceutical Industry Development Advisory Committee. Through PIDA, the Department encourages development of a more efficient pharmaceutical industry; by means of financial assistance, firms are encouraged to form corporate units able to employ competent management and other personnel, perform suitable research and development and undertake effective marketing programs. It enables generic drug manufacturers to improve their ability to manufacture and market lower-priced prescription drugs at more competitive prices by reorganization of their manufacturing and marketing systems. The program is particularly helpful to smaller drug manufacturers. Direct loans at commercial interest rates are available to provide the capital necessary for implementation of approved pharmaceutical industry development proposals.

Program to Enhance Productivity (PEP). PEP offers outright grants of specific amounts up to \$50,000 to support half the costs of carrying out intensive feasibility studies on the use and application of innovative techniques to achieve significantly lower unit costs of production in manufacturing and processing industries in Canada.

To be considered for a grant, an applicant should have under development, with reasonably good hope of success, some application of existing technology to the production phase of his operation as distinct from the research stage. If further data on the projected gain

in productivity cannot be obtained without committing additional financial resources to a more extensive in-depth feasibility study, and if the investigation would otherwise be shelved, money may be made available under PEP. The program is, however, designed to eliminate support for projects that would in all probability be carried out in the normal course of events.

If the study includes carrying out market research, not more than 25% of total approved costs should represent this component.

Program for Export Market Development, an incentive-based program, is designed to help increase exports of Canadian goods and services on a continuing basis. Under the plan, Canadian companies may obtain repayable grants toward defraying approved expenses which would otherwise inhibit their attempts to earn a share of markets. The program is divided into four main components defined in terms of regions, products and the marketing techniques concerned.

Section A, incentives for participation in capital projects abroad, are applicable anywhere outside Canada. The term "capital projects" as used here is intended to describe facilities, systems and other projects requiring the provision of skilled services, engineering products and other capital goods. Section B, market identification and marketing adjustment, emphasizes manufactured goods but it can be more widely applied. It is applicable anywhere outside Canada and the continental US. Section C, participation in trade fairs abroad, is not restricted as to markets, products or services. It is applicable anywhere outside Canada but participants in Canadian national stands at the same fair abroad are not eligible. Section D, incoming foreign buyers, also has no restrictions on markets, products or services. Buyers from anywhere outside Canada and the continental US may be invited by a company to examine products and production in Canada.

The Department's contribution will normally be 50% of eligible costs incurred. If a company receiving assistance succeeds in obtaining the business sought, repayment of the Department's contribution will be required, but no repayment is required if the company is unsuccessful.

Promotional Projects Program. The program of trade fairs and missions was set up to promote the export of Canadian products and services. It is an expression of federal initiatives in which Canadian industry is invited to participate. The program consists of a number of sponsored promotions designed to meet particular requirements and includes: trade fairs abroad — vertical and horizontal; missions — incoming and outgoing; in-store promotions; travelling sample shows; incoming trade delegates and buyers program; export-oriented training program; and under the programs for export market development, the incentive for participation in trade fairs abroad; and the incentive for incoming foreign buyers.

Fashion Design Assistance Program (FDAP) has as its primary objective an increase in competitiveness of the Canadian apparel, textile, leather and footwear industries at the international level by encouraging greater Canadian design creativity and upgrading product quality, building a prestige image of creative fashion design in Canada to attract Canadian and foreign buyers, and by providing an environment to encourage and retain Canadian fashion design talent.

There are two main aspects of the program — Designer Development and Fashion/Canada. The aim of the Designer Development component is to expand opportunities for the development and appreciation of trained Canadian fashion designers. Fashion/Canada encourages fashion awareness by promoting good design and workmanship by Canadian designers.

Counselling Assistance to Small Enterprises (CASE) provides an opportunity for owners and managers of small businesses engaged in manufacturing or tourism to benefit, at nominal cost, from a service provided by retired business executives selected for their management experience. Under special circumstances, government contributions can also be made toward the cost of engaging consulting firms. The program operates from offices in Montreal and Winnipeg which were opened in 1972.

Through the CASE program, the managements of small companies can discuss their particular problems with experienced businessmen, explore new ideas to help their businesses grow and examine new methods for improving productivity. A CASE counsellor will visit the applicant's place of business, make a detailed analysis of the company's problems and

opportunities and recommend action to be taken. He may also help to implement these recommendations.

In the allotment of CASE resources, priority will be given to Canadian-controlled businesses.

Development of Management Courses Program is designed to help non-profit professional, industry, business or management associations develop management retraining or upgrading courses of high quality. Assistance is in the form of government grants that may cover up to 100% but usually not more than 75% of the cost of developing new course material or revising the material for existing courses.

17.3.2 Provincial assistance

Assistance given by the respective provincial governments to manufacturing within their own territories is outlined in the following paragraphs.

Newfoundland. The Newfoundland government, through its Department of Industrial Development, offers advice and assistance to prospective industry in determining desirable plant locations in the province and in the preparation of feasibility studies. Information can be made available on the source and availability of raw materials, transportation costs, labour costs and a variety of other economic data. The government will transport industrialists anywhere in the province so that they may obtain a first-hand look at potential plant sites. The Department of Industrial Development also provides liaison with the public and private sectors.

Financial assistance may be provided by the Newfoundland and Labrador Development Corporation. This assistance may take the form of loans against the securities offered by the prospective enterprise, or the acquisition and holding of shares or other securities of any company wherever incorporated, with the right of the enterprise to buy back these shares. This Corporation will also be providing a complete range of management advisory services.

The government may provide direct financial assistance based on cost-benefit analyses. Buildings, where they exist, and land may be provided on very attractive terms. Industrial training facilities are available throughout the province for specialized courses to meet the requirements of incoming industry.

Prince Edward Island. Provincial assistance to manufacturing is generally funnelled through Industrial Enterprises Incorporated (IEI), a Crown corporation of the provincial government. It is prepared to offer assistance to prospective Island industries by way of long-term financing at attractive rates of interest. IEI assists industries by acting as a clearing house for information regarding alternate sources of credit in financing through other lending institutions or outright grants that may be available from government sources. IEI is also equipped to provide research and management services to existing Island industries or to groups contemplating new projects on the Island.

The Act incorporating IEI is particularly flexible in the terms of reference describing the manner in which IEI may participate financially in assisting industry in the province. Participation is generally by way of a first mortgage on facilities but could well be in the form of an equity position. The ratio of IEI's participation to that contributed by the investors has been very generous in the past and, necessarily, will be negotiated on an individual project basis in the future.

Nova Scotia. The province offers two programs of direct financial assistance to new or expanding manufacturers.

Industrial Estates Limited (IEL), a provincial Crown corporation formed in 1957, may finance 100% of the cost of land and buildings and up to 60% of the installed cost of machinery and equipment of new or expanding Nova Scotia manufacturers. The terms and conditions of financing are negotiable. IEL has made special arrangements with most Nova Scotia municipalities to limit local taxes paid by its clients to 1% of the building cost for a period of ten years. Additionally, IEL's Small Business Financing Division will assist manufacturing or processing industries having annual sales under \$750,000 through loans, loan guarantees and minority equity positions.

The Nova Scotia Resources Development Board, affiliated with the Department of Development, is an amalgamation of already existing boards including the Industrial Loan

Board, the Farm Loan Board, the Fisherman's Loan Board and the Timber Loan Board. The new Board will provide financing for tourism facilities, farms and primary agriculture processing, fish plants and vessels, saw and planing mills, and timberland.

Special municipal tax assistance which is authorized under the Nova Scotia Bonus Act may provide assistance to new or expanding firms by limiting either the assessment or the tax rate for a specified period of time.

The province co-operates closely with the Cape Breton Development Corporation, a federal agency, and contributes financially to some of the industry-development projects initiated by it (Chapter 4, Section 4.5.2).

New Brunswick. The Department of Economic Growth co-ordinates and implements the broad strategy of economic and industrial development activities in the province. It has three operating branches.

The Special Programs and Transportation Branch is responsible for directing and co-ordinating provincial transportation policy, the Special Areas Agreements between the province and the federal government as they apply to Saint John and Moncton, assistance to community groups to foster regionally initiated actions to establish and enlarge local industrial development, and provincial communications policy. The Transportation Division, working closely with its federal and provincial counterparts in the Atlantic Provinces, is involved with the Federal-Provincial Committee on Atlantic Regional Transportation and the Maritime Provinces Transportation Committee set up by the Council of Maritime Premiers. Through these bodies the Division advocates the development of national and regional transportation policies that make use of transportation facilities as development tools while recognizing the inherent characteristics of regional and provincial transportation systems. It is also concerned with airport and port developments and industrial transportation problems.

The Branch's Special Areas Division plays a major role in co-ordinating all aspects of the expansion and infrastructure programs in Saint John and Moncton under the Special Areas Agreement. The Special Areas Agreement, between the province and the federal Department of Regional Economic Expansion, outlines a joint strategy for maximizing economic and social adjustment by creating new employment opportunities through improving the environment to attract new activities in secondary manufacturing, commercial services and the expansion of resource-based industry in the two areas. Approximately \$91.5 million were provided under the Agreement for various infrastructure projects. The Special Areas Division assists the municipalities in developing an appropriate growth strategy and monitors the adherence of planning, design and construction functions to the time and financial schedules outlined in the Agreement.

The Regional Development Division's activities are concerned with assisting regional and community groups in areas of the province other than the Special Areas to organize themselves so as to be better equipped to accommodate industrial development. The Division has confined its activities primarily to the northeast of the province, the area encompassed by the FRED Agreement, where its function is largely to provide technical support in the industrial development field to the broader functions of the Community Improvement Corporation the provincial agency set up to administer the FRED Agreement. In other areas, the Division provides advisory assistance to communities on such subjects as organization of local development efforts, local promotion, and industrial land development and administration when requested to do so. Communities assisted in the past include Edmundston, Sussex, McAdam, Plaster Rock, Newcastle, Chatham and Nackawic.

The Branch has recently assumed a new role in the communications field. Activities include formulating provincial policies relating to all forms of communications media, particularly increased radio and TV coverage, especially in the French language, and to carry negotiations with federal, provincial, and regional bodies concerned with the communications field.

The Trade and Industrial Services Branch, through its Resource Utilization Division and Industrial Services Division, provides a support function for secondary industry in the province. The Industrial Services Division complements programs offered by the federal Department of Industry, Trade and Commerce in industrial research and development, product design, industrial technology, productivity, and duty-free imports of production machinery with a substantial external trade promotion program. This program includes trade

fairs and missions, licensing arrangements and assistance in documentation, market research, and identification of export opportunities. The Division also offers technical assistance through the provision of industrial engineering assistance, production control, and other engineering services and is responsible for implementing the government's program of maximizing New Brunswick product content in public construction. The Resource Utilization Division is primarily concerned with the provision of a variety of marketing, technological and management services to natural resource-based industry in the province. For the next few years the Division's primary role will be somewhat limited to the problems of the wood-using and sawmill industries in the province although it is becoming involved initially on a project basis with mines, minerals, and other resources, particularly the peat moss industry.

The Investment Management Branch is concerned primarily with review and evaluation of industrial projects for which application has been made to the New Brunswick Industrial Finance Board for financial aid. This assistance may take the form of a guarantee for a bank loan or bond issue, a direct loan, and the follow-up services to firms to which the Industrial Finance Board has already been committed. The principal form of assistance is a bank loan guarantee primarily for expansion of existing industry unlike the approach of the New Brunswick Development Corporation which is concerned mainly with developing and locating new industry in the province. The Branch, however, is still active in receiving new industry which may prefer to deal directly with the province.

The Investment Analysis Division of this Branch assists firms in drafting development plans and in making application for financial assistance. It evaluates and makes recommendations on projects presented to the Industrial Finance Board and ensures that adequate safeguards are incorporated into agreements to provide provincial assistance. The Management Services Division is concerned primarily with identifying impending problem areas and taking action to protect provincial commitments in industrial projects. The Division provides for regular audit and inspection of firms receiving financial assistance, for management and consultative services to firms in order to overcome or avoid problems, and for trustee management in severe situations where provincial funds are seriously threatened. Both Divisions of this Branch attempt to ensure maximum utilization of federal and provincial development programs in order to facilitate the establishment and expansion of industry.

Quebec. In 1971, legislation dealing with financial aid to industry was combined under two Acts: Bill 20, the Quebec Industrial Development Assistance Act, which created the Quebec Industrial Development Corporation; and Bill 21, "an Act to promote industrial development through fiscal advantages". The Industrial Development Corporation replaces the former Quebec Industrial Credit Bureau which has been abolished.

The aim of these programs is to help transform Quebec's industrial structure through aid to new high-technology industries and to already existing industries which regroup their production facilities to improve their competitive position. Companies unable to obtain financial assistance elsewhere at reasonable rates are eligible for aid under these programs if it would contribute to the economic development of the province or any of its regions. The amount of assistance granted depends on the area, the kind of goods manufactured and the production techniques used.

The Industrial Development Corporation may grant financial assistance to a manufacturing establishment making a capital investment for construction; purchasing or expanding a plant or factory; investing in machinery, tools or equipment; purchasing licences or patents; or improving the financial organization of the business. Depending on the nature or needs of the company concerned the assistance may take various forms: loans at lower-than-market interest rates; assumption of part of the costs of a loan; exemption from repayment of part of the loans which the business has contracted with the Corporation in accordance with established criteria as to productivity and the number of new jobs created; purchase, by the Corporation, of buildings or machinery for resale or rental to a manufacturer; and purchase of shares of any manufacturing industry up to a maximum of 30% of the paid-up capital stock of the company.

Under the new legislation, the government may grant a reduction in income tax on corporation profits on any investment in Quebec by manufacturers provided the amount of the investment is at least \$150,000. Permissible investments are for building or expansion of plants or factories or for the purchase of new machinery, tools or equipment. In computing their

profits, approved companies may deduct up to 30%, 50% or 100% of their investment depending on the region in which the investment is made.

A manufacturing or processing plant selling and delivering part of its Quebec production outside the province may receive exemption from provincial sales tax on goods purchased for its use or consumption in the proportion that its out-of-province sales bears to its total sales for the year. Under the same program, a business may be exempt from provincial sales tax on gas or electricity used directly for processing.

Through its support of the Quebec Industrial Research Institute, the province makes technical information and assistance available to industry throughout the province (see Chapter 9, Section 9.3.3).

Ontario. The Ontario Development Corporation and the Northern Ontario Development Corporation are agencies of the Crown established by the government of Ontario to provide financial and advisory services to business in order to stimulate industrial growth, economic development and employment opportunities in the province. They report to the Ontario legislature through the Minister of Industry and Tourism. The corporations' activities are governed by boards of directors composed of representatives from the business and financial communities and labour.

Loan programs administered by the ODC and the NODC include interest-free performance loans which may be forgiven over six years and term loans with repayment fitted to meet the individual circumstances of each borrower. Performance loans are available to Canadian-owned secondary manufacturing industries for new or expanded facilities in designated areas. Major tourist attractions may also qualify.

Term loan programs include: Small Business Loans to Canadian-owned companies in all parts of the province to expand their operations in fields of manufacturing or services closely allied to manufacturing; Venture Capital Loans to Canadian-owned companies for the introduction of new technology; Pollution Control Equipment Loans to companies which must install approved pollution control equipment and are unable to finance it from their own resources; Tourist Industry Loans for tourist resort operators to upgrade their facilities; Export Support Loans to finance the production and warehousing of goods for export against specific orders; and Industrial Mortgages and Lease-backs to assist with the establishment of new manufacturing facilities.

The ODC administers Northam Industrial Park in Cobourg and Huron Industrial Park in Centralia with industrial space and housing available on a rental basis. It also manages the sale and leasing of property in Sheridan Park near Toronto to companies engaged in industrial research and development.

The Business Development Division of the Ministry of Industry and Tourism provides advisory services on financial and marketing matters through three branches. The Industrial Development Branch provides advice on location and expansion of manufacturing facilities, sets up manufacturing arrangements for Ontario companies and provides technological research and advice to improve and promote products. Seminars and product development clinics keep businessmen informed of market situations and advances in technology. The Trade Development Branch can help potential or existing exporters to participate in sales and trade missions, and trade exhibitions; bring foreign buyers to Ontario and arrange interviews for manufacturers. The Tourism and Service Industries Development Branch provides information on location and expansion of tourist operations, economic studies and other pertinent material; it advises tourist and service industry operators on ways to increase and improve their operations.

The International Division operates a trade, industry and tourist incentive program in 16 world markets: New York, Chicago, Los Angeles, Boston, Atlanta, Cleveland, Minneapolis/St. Paul, London, Frankfurt, Milan, Stockholm, Vienna, Brussels, Tokyo, Sao Paulo and Mexico City. The Ministry of Industry and Tourism opened a Trade and Travel Centre in Toronto in 1972. This Centre offers display space to manufacturers, interview rooms for discussions on potential licensing arrangements, joint ventures and exporting agreements, and houses a theatre for the showing of films and slide presentations.

The Sheridan Park Corporation has established the Sheridan Park Research Community at Mississauga, which has research laboratories and facilities that offer an interchange of ideas and techniques and help participating companies to stay competitive in world markets.

Research creates new and improved products as well as better utilization of natural resources. This unique \$42 million community employs some 1,600 persons in ten resident companies and corporations. (See also Chapter 9, Section 9.3.4.)

The Ontario Economic Council is a 20-member advisory group which reports to Cabinet on methods to encourage maximum development of human and material resources throughout Ontario. Members of the Council are private citizens who serve without pay. (See also Chapter 4, Section 4.5.3.)

Manitoba. The Department of Industry and Commerce, established in 1948, is the development arm of the Manitoba government in achieving its goal of planned improvement in the provincial economy through industrial development. The key objective of the Department is to attract and establish employment-generating activities and enterprises throughout the province, particularly in rural areas. To do this, it has established various branches and agencies, using an organizational concept that provides industry specialization combined with comprehensive program support.

The Trade and Industry Group consists of four branches with specific commodity interests: Food and Drug, Machinery and Equipment, Industrial Materials and Construction, and Consumer Products; and a fifth, the Trade Development Branch which promotes the export of all commodities. Each of the commodity branches is charged with the responsibility of fostering economic growth in its sector, through expansion of existing firms and attraction of new investment. Each studies trends in its sector, identifies business opportunities, and assists firms through market research, business development and casework.

The Programs and Productivity Group has five branches directly concerned with the implementation of programs in the areas of science and technology, design improvement, transportation and distribution systems, productivity and management development and regional planning and development. Some 60 professionals plan and carry out all programs, consulting and engineering services and research activities. In addition, the Department works closely with other agencies on matters affecting Manitoba's economic development. The following associated agencies are special-purpose bodies of private citizens supported by Department staff.

Through the offices of the Trade Development Branch the Manitoba Export Corporation assists Manitoba firms in developing export sales. It works closely with each industry branch and is empowered to appoint agents abroad and to handle exports for Manitoba manufacturers. Services include extensive practical advice on pricing, documentation, export procedures and tariffs, the organization of trade fair participation, incoming and outgoing missions, and the export of professional services. The Corporation can assume all duties of an export department for Manitoba companies. The Manitoba Design Institute promotes and encourages the application of industrial design principles in Manitoba companies through a series of seminars, workshops, product evaluation sessions, packaging clinics and direct assistance.

The Manitoba Research Council serves as a focal point to encourage and co-ordinate technical undertakings in the province. It encourages co-operation between scientists and engineers in government, universities and community colleges, and industry to meet the special needs of the province arising from location, climate and resources. Several programs of innovation assistance have been devised by the Council, including an Industrial Enterprise Fellowships program to encourage research teams to use their skills to foster the creation of industrial enterprises. Other programs involve sponsoring, in industry or educational institutions, of research projects of potential economic benefit to the province. Four advisory committees of council have been commissioned to help develop centres of excellence in research in specific subject areas. A technology transfer program is available to industry, including assistance with licensing arrangements. (See also Chapter 9, Section 9.3.5.)

The Manitoba Development Corporation is a Crown corporation established in 1958 to encourage balanced development of industry in the province. The Corporation provides financial or other assistance to new and existing industrial enterprises and to community development corporations as well as technical and business advice and guidance to persons and organizations receiving financial assistance and, on request, financial consulting services to other industrial enterprises; promotes diversification of business activity and improvement of existing industry; helps develop export markets for Manitoba products; and encourages the expansion of small- to medium-sized enterprises in Manitoba. The Corporation considers

applications for requirements of essential service industries outside Winnipeg. Loans are generally extended when financing is not otherwise available on reasonable terms and conditions, and provided the owner has a reasonable investment in the business.

The Communities Economic Development Fund was established in July 1971 to further the economic development of the remote and isolated communities of the province with particular emphasis on economically disadvantaged persons. Assistance usually is in the form of term loans to finance existing business enterprises and to establish new ones. Much of the assistance directed by the Fund to northern Manitoba is related to the development of business enterprises by and for people of native ancestry and loans may be made to individuals, partnerships, corporate entities, community councils and to Indian bands.

Manitoba Regional Development Corporations are non-profit organizations set up in 1964 to undertake promotion in a wide sphere of regional interests. They were conceived as a response to some of the challenges facing the rural areas of the province — population out-migration, a slow economic growth rate, and the need for action on a regional basis. Through its Regional Development Branch, the Department of Industry and Commerce has therefore encouraged the formation of regional development corporations in Manitoba with the province contributing to their operating costs. Over the past nine years, seven corporations have been established covering all of Manitoba outside of the city of Winnipeg.

Manitoba offers a number of programs to assist Manitoba companies engaged in production/processing, distribution or specialized construction. The Feasibility Studies Incentive Program assists companies in commissioning the necessary studies to develop plans for establishing or expanding manufacturing facilities in Manitoba, and in making application to obtain grant assistance from the federal Department of Regional Economic Expansion. The Research and Development Assistance Program enables eligible Manitoba companies to develop innovative products or processes or methods for utilization of the natural resources of the province and allows educational institutions to undertake research and development of significant and direct economic benefit. The Productivity Improvement Program provides productivity audit analyses of individual firms and industry groups by specialists who identify problem areas, obstacles to growth and opportunities for improvement in the marketing, production, technology, manpower, organizational effectiveness and financial areas of the firm, and make recommendations suited to the needs and capabilities of the firm, including a blueprint for action. The Manpower Development Assistance Program assists Manitoba companies in analyzing productivity and designing personnel training programs to meet specific company requirements. The Design Improvement Assistance Program makes funds available to assist companies in improving the design and quality of their products. The Manitoba Export Assistance Program gives financial support to Manitoba manufacturers who wish to sell goods or services in markets outside the province. The program provides assistance by exhibiting products at trade fairs, bringing potential buyers to Manitoba and organizing sales missions, and by promoting the export of professional services.

The Manitoba Airport Assistance Program provides grants and loans to municipal airport commissions in southern Manitoba for the development, improvement and maintenance of airports, licensed for night flying by the Ministry of Transport.

Saskatchewan. The primary objectives of the recently reorganized Department of Industry and Commerce are to stimulate the growth of the Saskatchewan economy and to broaden and diversify the economic base of the province, thereby helping to increase personal income and creating job opportunities for the labour force. The activities and programs of the Department are carried out through its branch organization.

The main functions of the Industry Development Branch are to: encourage the establishment of new manufacturing, processing, distribution and warehouse facilities, resource industries and industrial service operations; assist existing firms to expand and diversify their manufacturing, service and distribution facilities; locate and evaluate development opportunities in manufacturing, processing and resource development, and in the service and warehousing sectors; and compile, publish and distribute information on all phases of Saskatchewan's economic development and potential.

The objective of the Business Assistance Branch is to revitalize and support existing business enterprises in the province by providing counselling and consulting expertise in the fields of accounting, merchandising, transportation and marketing. To make these services

accessible to business firms throughout the province, branch representatives will be located at six centres outside Regina.

The Trade Development Branch is primarily involved in the promotion of trade in Saskatchewan products in regional, national and international markets, particularly in the US, Europe and the Pacific Rim. The prime contact points for this program are the office of the Agent-General in London, England, and a soon-to-be-established trade office in the Pacific Rim area.

The Tourist Development Branch undertakes activities to assist the Saskatchewan tourist industry to further its development. These activities include: carrying out a marketing program to motivate travel to and within Saskatchewan; providing advice and information, both printed and oral, to persons wishing to travel in the province; and assisting, through counselling, advice and grants, in the development of tourist plant and tourist attractions.

The new Research and Development Branch has as its main responsibility the collection and dissemination of statistical data, and the preparation of, or contracting for, economic feasibility studies, in order to uncover what imports and new products might be produced in Saskatchewan, and what primary products can be further refined or processed in the province.

Operation Recycle is a special project initiated to administer the collection of abandoned or scrap vehicles for shredding into acceptable steel furnace feed. It is estimated that approximately 100,000 vehicles will be collected over a three-year period and other recycling projects are under active consideration.

The Industry Incentives Act encourages the establishment, expansion and modernization of industry in certain areas of the province. The program provides assistance in the form of forgivable loans to new or expanding manufacturing establishments. These loans are interest-free and are made for a period of six years over which the amount of the loan is forgiven. The Industry and Commerce Development Act authorizes the Department to: make grants to local governments or civic groups for the construction of major tourist facilities or for the promotion of major events and attractions; undertake, either for its own use or on a shared-cost basis with business enterprises, feasibility studies and research to identify new business opportunities; provide, either through department representatives or outside consultants, counselling and advice on all forms of business problems; and make available financial assistance to a community-based group to continue the operation of a business establishment threatened by closure which would seriously disrupt the community in which it is located.

The province also provides financial assistance to business enterprises through the Saskatchewan Economic Development Corporation (SEDCO), a Crown corporation. SEDCO was originally established in 1963 to provide loans for the establishment or expansion of manufacturing enterprises. Since August 1972, its terms of reference have been significantly broadened to permit the provision of financial assistance to virtually all types of businesses. In addition to industrial enterprises, SEDCO loans may now be made to retail, wholesale and service businesses. SEDCO assistance can take many forms, the most common of which is a first mortgage loan over a medium term. Security for such loans consists of specific pledges of land, buildings and/or equipment, and the support of the individuals involved in the business is normally pledged as well. Repayment terms for such loans are designed to suit the income pattern of the enterprise, and may include such features as step-payments, seasonal payments or similar arrangements.

Loans can be granted for terms varying from a few months to 20 years and in amounts from a few thousand to many millions of dollars. The term is determined by the estimated life of security pledged and by the earnings of the business. Equipment based loans would be for five to eight years, while building and equipment loans might be eight to 12 years, and real estate alone as security would warrant a loan of up to 20 years. Working capital loans would range from one month to two years.

In all cases, the Corporation expects that the owners of the borrowing company will have a reasonable equity contribution in the enterprise. In certain instances, the Corporation may consider taking an equity investment in its own right if required to maintain a reasonable balance between debt and equity. The Corporation also has industrial sites and buildings which it is prepared to make available to eligible enterprises. Lease, lease-purchase or outright sale of such properties can be considered and, in certain circumstances, the Corporation will consider constructing a facility for the subsequent sale or lease to a prospective client.

Alberta. The province assists industry through the facilities of the Alberta Opportunity Company (AOC), a Crown agency created by the Alberta Commercial Fund Act on July 1, 1972. It succeeded the Alberta Commercial Corporation and the Alberta Industrial Incentives Board.

The objective of AOC is the promotion of economic growth by stimulating the establishment of new businesses and aiding in the expansion of existing enterprises. In pursuing this objective AOC gives priority to Albertans and Alberta-owned enterprises, small businesses, centres of small population, job-creating projects, research and development projects, promotion of marketing and export potential, enhancement of tourist potential, provision of employment and business experience for Alberta students, encouragement of local development groups and promotion of pollution control projects.

In order to qualify for assistance, a business may be a proprietorship, partnership, co-operative, or corporate body, must be a business operating for gain or profit, must be located or to be located in Alberta, must provide assurance that any assistance provided will be utilized exclusively within Alberta, and must be of a type considered by the Company to be eligible within the terms of the Act and its Regulations. Eligible types of business include: manufacturing, processing and assembly operations, service industries, commercial wholesale and retail trade, recreational facilities, tourist establishments, local development organizations, student business enterprises, and new industries of any kind which are unique and valuable additions to the province. The program is not designed to apply to finance companies, suppliers of residential accommodation other than tourist facilities, public utilities including power generation and distribution, resource-based industries such as mining and quarrying, oil and gas production, logging, farming and ranching.

A number of considerations enter into the decision as to whether or not assistance will be granted: the contribution the project would make to the economy, the local community and the province as a whole; economic viability of the proposal considering capabilities of management, the business environment, adequacy of over-all financing and technical and ecological considerations; proof that the financial assistance requested is not obtainable from other conventional sources on reasonable terms and conditions; and the availability of security to provide reasonable protection. The purposes for which assistance may be provided include: establishment of new businesses, acquisition of fixed assets — land, buildings and equipment, expansion of existing facilities, strengthening working capital, financing raw material or finished inventories for manufacturers, research and development projects.

Financial assistance is made available on a direct basis or by guarantee in various forms: Capital Loans up to 80% (maximum \$500,000) of approved capital costs; Working Capital Loans (maximum \$500,000); Inventory Financing for manufacturers (maximum \$500,000) for the stockpiling of either the raw materials used in the manufacturing process or finished products resulting from that process, in actual operation AOC will purchase the inventory from the manufacturer under a buy/sell agreement at established prices to a level of 80% of "laid-in" cost or wholesale price, as the case may be; Research and Development Loans up to 50% (maximum \$10,000) of the total cost of an approved project undertaken by a commercial enterprise. Such projects are restricted to applied research and development programs which contribute to improvements in one or more of the following areas: technological advances to products or development of new products; technological advances to production facilities; adoption of improved management techniques; and development of new markets.

Business management counselling services may be provided without charge by AOC professional consultants and include management advice and guidance on financial, technical and marketing matters for small- and intermediate-size Alberta businesses which are not in a financial position to obtain this type of assistance elsewhere. Services under the program are provided through the Company's head office in Edmonton and its southern area office in Calgary. Financing programs are individually dealt with by an experienced staff of professional personnel. Applications for assistance call for suitable back-up material, such as financial statements, etc., which is studied and broadly assessed. Applications are considered for approval by the Board of Directors and, normally, funds are available in four to six weeks.

British Columbia. The functions of the Department of Industrial Development, Trade and Commerce are to encourage industry, to expand foreign trade, to investigate matters of economic importance, to collect and publish statistical information and to assist in regional industrial development. In these fields, the Department is organized to assist existing activities

and encourage new enterprises by placing its facilities at their disposal, and to co-operate in all problems incidental to establishment. Direct financial assistance is not provided for manufacturers except for the provision of bounties for the production of blister copper or refined copper and a bounty for pig iron of British Columbia origin used for steel-making purposes in the province.

The chief means employed by the British Columbia government to promote industrial development are to: develop the basic provincial infrastructure, including the extension of rail services to northern centres by the provincially owned British Columbia Railway and develop electric power facilities by the British Columbia Hydro and Power Authority; provide economic data and analyses relating to markets, production wage costs, etc. (a function of the Economics and Statistics Branch of the Department); and assist in locating plant sites. The Department maintains an industrial and trade office in London, England.

17.4 Merchandising and service industries

Data on merchandising and service activities are derived principally from a periodic census (or full-coverage survey) of the businesses engaged in such activities. The first census was taken in 1931, followed by similar censuses in 1941, 1951 and 1961. The reports for 1961, which provided a wider range of data than any previous census, contained information on sales, inventory and credit; gross margins and operating expenses; small geographic area data; and, for "establishments" only, an analysis of sales by commodities. For census purposes, a location is defined as "a recognizable place of business in which the principal activity is the display and sale of goods or services to the general public for personal or household consumption". In other words, the location series provides aggregate data on the physical locations in which retailing or service activities actually take place. The establishment, on the other hand, is "the smallest unit which is a separate operating entity capable of reporting those elements of input and output necessary to the calculation of gross margin, as well as employment, wages and salaries". The location is not dependent on the system of accounting; the establishment is.

The 1961 Census marked the end of the decennial census program. In 1966, the censuses of merchandising and service establishments became part of a quinquennial series in order to provide more frequent survey benchmarks and to enable publication of more up-to-date statistics than was previously possible. The 1972 *Canada Year Book* pp. 979-986 lists the reports produced as a result of the 1966 Census of retail and service trades and provides summary data from a special study based on the 1966 Census of wholesale trade. In the 1971 Census, the data requirements – because of greatly increased demands for information from the public and private sectors – are considerably more detailed than at any time in the past; results of this census will begin to be available early in 1974.

The service trades embrace a wide spectrum of activities engaged in by professional, business and personal service establishments. Included are the amusement and recreation services, which include regular and drive-in movie theatres, bowling alleys, health clubs, golf courses, race tracks and other sports activities, and the fast-growing accommodation and food service fields, comprising hotels, motels, tourist facilities, restaurants and drive-in "fast food" outlets. The degree of interest being shown in the services field is further indicated by the number of trades which were surveyed for the first time in the 1971 Census. These include, in the amusement and recreation services group, marinas, ski-facility operations, driving ranges and miniature golf courses; and, in the business services group, computer services, media representatives, architects, professional engineers and other engineering and scientific services, lawyers and notaries, and management and business consultants. A number of these "new" trades (computer services, engineering services, etc.) will be the subject of separate studies to be undertaken during the next three years. Services provided by doctors, dentists, nurses, hospitals and educational institutions remain outside the scope of the Census of Merchandising and Services.

Each census, as it is completed, forms a new base for the various intercensal (monthly, quarterly and annual) surveys of retail, wholesale and service trades: some are sample surveys and others are carried out on a full-coverage basis. Section 17.4.2 contains current intercensal information obtained as a result of these surveys, relative not only to the distributive trades but to other statistical series (i.e. consumer credit) as well. It should be noted that all of these data are on the 1966 base.

17.4.1 1971 Census of Merchandising and Service Businesses

The 1971 Census of Merchandising and Service Businesses represents the final phase of the 1971 Census of Canada, the major part of which took place in June 1971. Unlike the first three phases (population, housing and agriculture) the business census was conducted early in 1972 as it measures business activities over a complete financial year. Results will be available early in 1974. One of the purposes of the census is to provide government agencies and private users with a detailed picture of the situation at a fixed point in time in the distributive and service trades.

17.4.1.1 Government sector

The Census of Merchandising satisfies the requirements of an integrated System of National Accounts (SNA) in relation to the retail, wholesale and service industries. Following is a set of definitions showing how the answers obtained relate to specific requirements of the SNA. (For a more detailed discussion of the SNA see Chapter 21.)

Personal expenditure on consumer goods and services. This figure accounts for more than 60% of gross national expenditure and is composed primarily of data collected on the retail and service industries. Personal disposable income (personal income less direct taxes) less personal expenditure on goods and services equals personal net saving.

“Make” matrix shows the distribution by commodity of the output of each of the industries and the distribution by industry of the output of each of the commodities. In other words this matrix shows the market shares of commodity production by industries.

Value of physical change in inventories. The net change during the year of business holdings of inventories must be included in the gross national expenditure in order to allow for that portion of current production (purchases) which has not yet been sold (positive change in inventories), or to eliminate that portion of previous years' production (purchases) which is included in sales of the current year (negative change in inventories). The change in the value of inventories relevant to gross national expenditure should reflect a change in physical volume valued at the average market prices of the period. This change is referred to as the value of the physical change in inventories.

Inventory valuation adjustment. Since inventories often contain goods produced (purchased) in previous years, an adjustment of book values is necessary to allow for the valuation of the carry-over portion. To make this adjustment, it is necessary to estimate the commodity content of inventory holdings, the normal turnover period for the industry, and the accounting methods used by the firms in arriving at book values. The book value of inventories is deflated to remove the effect of price changes and the derived “physical” change is then valued at average prices of the current period to obtain the value of the physical change. The inventory valuation adjustment is the difference between the value of the physical change and the change in book value. This adjustment is made to the National Income to remove, from corporation profits and the net income of unincorporated businesses, any inventory gains or losses arising from the effect of price changes on the holding of inventories.

Census value added is a concept which evolved from the Census of Manufactures as a measure of output applied to an industry. It is obtained by deducting from the value of gross output in a period, the value of materials used, the cost of light, heat and power, the cost of goods purchased for resale and some service expenses. An approximate equivalent in the retail, wholesale and service industries is “mark-up on sales” which is the difference between sales and the purchase price of goods sold in a period.

“Absorption” matrix shows distribution by industry of the input of each of the commodities and, in each column, the distribution by commodity of the input of each of the industries. In other words this matrix shows the distribution by industry of the materials and services and primary factors of production such as depreciation, salaries and wages, employee benefits, etc. used by each industry.

The “make” and “absorption” matrices, together with information on net final demands, provide the basic data for input-output tables.

Value added. The value added of industries at true factor values is equal to the true factor value of their gross output less the true factor value of their intermediate inputs. It is a further refinement of the “census value added” concept in that the intermediate inputs or the costs of

goods purchased from other industries are known in addition to a proper measurement of producers' value (output) and purchasers' value (input). (See gross domestic product at factor cost for equivalent.)

Gross domestic product at market prices is defined as gross domestic product at factor cost plus an adjustment for the residual error of estimate and indirect taxes less subsidies.

Gross domestic product at factor cost. This can be calculated in three ways from the data collected by the 1971 Census of Merchandising and Service Businesses, as follows. (a) The measurement of gross domestic product (GDP) at factor cost can be obtained via the "census value added" approach, since such costs as advertising, insurance, repairs, communications, etc., purchased from other businesses can be deducted from the census value added of each industry (the latter already excludes major indirect taxes such as sales and excise taxes). The residual would then consist — after adjustment for other indirect taxes and subsidies — of factor incomes and capital consumption allowances (primary inputs) and would represent GDP originating in each industry. (b) The sum of the incomes accruing from production and depreciation; these include salaries and wages, employee benefits (supplementary labour income), net profit or income (before taxes) and depreciation (gross national income). (c) Gross domestic product is measured at constant prices (called real domestic product) as well as current prices. Real domestic product is obtained by deducting intermediate inputs at constant prices from gross outputs at constant prices. These data on real domestic product are also used to calculate labour productivity measures.

Personal income is broadly defined as the measurement of all income received by Canadian residents such as: factor incomes of persons; transfer payments received by persons such as family allowances and unemployment insurance benefits; and charitable donations which are treated as a current transfer from business to persons.

Productivity of labour. A measurement of the productivity of labour may be calculated by adjusting gross domestic product at factor cost through the use of the double-deflation technique to provide deflated real output. The result divided by the total man-hours employed equals a measure of the productivity of labour.

A measure of output per unit of labour input is obtained by matching real domestic product and corresponding labour inputs expressed in terms of man-hours or persons employed.

Sectoring. The allocation of data by form of organization provides information on the institutional arrangement of the Canadian economy in relation to the sectors. A full set of National Accounts must distinguish among various sectors of the economy and must account for assorted types of transactions undertaken by and/or between classes of transactors. Four broadly distinguishable classes of transactors can be identified whose economic motivations and behaviour are relatively homogeneous within each class, but essentially quite different from one class to the next. These are: persons, governments, businesses, and non-residents (i.e., the rest of the world).

Commodities in the measurement of personal expenditure on consumer goods and services. Personal expenditures on goods and services by type are obtained by aggregating the sales of various kinds of commodities, including both goods and services. Commodity sales estimates are based on commodity data derived from the Census of Merchandising and Service Businesses. These commodities or commodity groupings are further classified into durable, semi-durable and non-durable goods and the service component.

Weighting patterns through commodities. Weighting patterns are developed for the construction of appropriate indices, using retail commodity sales as the input at the finest level of detail.

Industrial distribution by industry of origin. An industry is defined as a group of operating units engaged in the same or a similar kind of economic activity. By classifying each operating unit to a particular industry, it becomes possible to illustrate the contribution of each industry to the input or output being measured.

17.4.1.2 Private sector

In addition to the detailed information obtained at the establishment or reporting unit level (for the provinces and Canada), a separate questionnaire obtained supplementary data

on sales, cost of sales, salaries and wages, employment and inventories for each business location and ancillary unit. This implies the tabulation of these data by three- and four-digit SIC classifications and kinds of business at the finest geographical level within the secrecy provisions of the Statistics Act.

Such data can assist businessmen and others in making better decisions; help in formulating policies to determine store or business location; enable the user to calculate share-of-market ratios; and provide a barometer of the sophisticated demands of today's knowledgeable consumers through an analysis of retail sales by commodity grouping.

The kinds of information which will be available as a result of the 1971 Census will be of interest to a wide variety of users — particularly (but not limited to) those already operating within the retail, wholesale, service and manufacturing industries. For example, the data will be widely used by market research houses and advertising agencies, as well as by educational institutions, academics and students, to determine market penetration and growth rates, and in basic research on economic activities at the local, provincial and national levels.

In addition, the statistical information will be of use to trade and business associations to analyze sales, inventory and other measurements for their members. Municipal planning boards and real estate developers will be able to use these data as factors in urban redevelopment and shopping centre planning. Franchisers can obtain detailed information on the penetration and viability of franchised businesses in the highly competitive retail and service sectors.

Merchandising and services statistics are also used in the communications field. Newspapers, periodicals and magazines include Statistics Canada data in their various reports on business in Canada and the United States. Information on the retail, wholesale and service trades, developed in the course of the 1971 Census, will form a major component of such reports.

17.4.2 Intercensal surveys

17.4.2.1 Retail trade

The trend of retail trade is one of the most accurate barometers of the economic health and well-being of the nation. In 1972, retailers absorbed 48.4% of personal disposable income available to Canadians and accounted for 51.7% of total personal expenditure on consumer goods and services. The value of retail sales, estimated from intercensal sample surveys and revised every five years to a new census base increased by 49.5% during the period 1966-72. Details of intercensal revisions may be found in *Retail trade, 1961-66* (Catalogue No. 63-517) and in *Retail trade, revisions to 1966-70 postcensal estimates* (Catalogue No. 63-519). Between 1971 and 1972, estimated sales rose by 10.7%, compared to a 9.3% increase between 1970 and 1971. This reflected not only the effect of inflationary trends but also the further strengthening of the economy during 1972. The current retail trade series, as shown in Table 17.20, classifies retail trade into 18 kinds of business and provides provincial totals over the 1966-72 period. Additional details on retail trade may be found in *Retail trade*, Catalogue No. 63-005 (monthly).

Chain and independent stores. Within the framework of retail trade, chains and independent retailers compete to achieve or retain a viable share of the total market. (A retail chain is defined by Statistics Canada as "an organization operating four or more retail stores in the same kind of business under the same legal ownership". A concession located in a department store is not considered to be a store location for the purpose of this definition.) In some kinds of business, such as motor vehicle dealers, service stations and garages, food stores other than grocery and combination stores, fuel dealers, and men's clothing stores, independent merchants have maintained a dominant position; in others, such as department stores, variety stores and general merchandise stores, chains account for the largest proportion of sales. In recent years, changes in market share have been most pronounced among women's clothing stores, grocery and combination stores, family clothing stores, jewellery stores and shoe stores. The constantly shifting balance between chain and independent stores is illustrated in Tables 17.21 and 17.22.

Department stores. In 1972, department stores accounted for a higher proportion of total sales than most other kinds of retail business — exceeded only by grocery and combination stores and motor vehicle dealers. Their sales of \$3,687.9 million represented 10.9% of total retail

trade and 14.2% of the business done by competing firms (all trades other than motor vehicle dealers, fuel dealers and parts of the "all other stores" classification). Department store sales in 1972 were 86.8% higher than in 1966, the largest increase among the 18 specified kinds of business (Table 17.20). However, growth among the various departments within department stores has not been consistent. Table 17.23 shows that the highest rates of increase have occurred in men's clothing; women's and misses' sportswear; photographic equipment and supplies; gasoline, oil, auto accessories, repairs and supplies; and sporting goods and luggage.

New motor vehicle sales. The largest homogeneous group of commodities sold within the confines of retail outlets is embodied in the classification "new motor vehicles". In the only current survey of retail trade carried on at the commodity level (all others are based on "kind of business"), new motor vehicles are taken to include private passenger cars and taxis, trucks, buses and other commercial vehicles sold at retail. As shown in Table 17.24, sales of new motor vehicles in 1972 reached a new high of \$4,315.4 million, based on the actual cost to purchasers (prior to 1967, the data were based on manufacturers' suggested list prices). The increase in new motor vehicle sales (21.4% over the 1971 level) is believed to have been primarily the result of rising economic conditions which prevailed during this period and which heavily influenced the sale of high-priced consumer goods.

In recent years, the sales of overseas-manufactured vehicles — both passenger cars and trucks — have been increasing at a faster rate than those of Canadian and United States manufacture. In 1972, however, following five consecutive years of growth in the market share of new overseas vehicles (based on number of units sold), the imports suffered a minor reversal. Sales of Canadian- and US-manufactured passenger cars rose at a faster rate between 1971 and 1972 than import models, resulting in a slight drop in total market share (from 21.4% to 20.8%) for all overseas-manufactured vehicles. Table 17.25 lists new motor vehicle sales, by type of vehicle and by source of origin, for 1971 and 1972. It will be noted that one out of every five new vehicles sold during 1972 was an overseas-built model, and that nearly one sixth of Canadian sales dollars went toward the purchase of such models.

Non-store retailing. Consumer goods, in addition to being sold in retail stores, often reach the household user through other more direct channels of distribution — commonly described as "direct selling". These channels are characterized by the fact that the commodities handled bypass the retail outlet completely in moving from manufacturer to distributor to household

consumer. Statistics Canada periodically carries out surveys of two distinct forms of direct selling — merchandise sales of vending machine operators, and of manufacturers and distributors specializing in direct-sales methods.

The survey of vending machine operators is designed to measure the value of sales made through automatic vending machines owned or operated by vending machine firms, including soft drink bottlers engaged in vending activities on a regular year-round basis. In 1971, such sales reached a new high of \$162.2 million, 3.5% above the 1970 total of \$156.8 million (Table 17.26). The 1971 sales were recorded by 697 vending machine operators through 101,550 automatic merchandising machines, including 1,476 microwave and infrared ovens and 2,109 coin and bill changers.

Although vending machines can be used to distribute many types of commodities, the largest proportion of sales has been accounted for consistently by three main lines — tobacco products, hot drinks, and cold drinks vended in bottles, cans, cartons and disposable cups. In 1971, sales in these three product areas amounted to \$132.4 million, an increase of 5.7% over the 1970 total. However, the over-all importance of tobacco products, hot drinks and cold drinks is declining. In 1960, these commodities accounted for 87.4% of all merchandise sold in vending machines; by 1971, this proportion had fallen to 81.6%. Among commodities sold in vending machines, tobacco products showed the largest increase in market share from 1970 to 1971 (Table 17.27).

Direct selling of manufacturers and specialist agencies. The first survey of direct selling, which was carried out in conjunction with the 1966 Census of Merchandising and Services, covered all manufacturing establishments which produce consumer goods as well as selected agencies specializing in direct sales methods. The data published since 1966 were estimates based on the results of a sample of businesses in these two areas. A new survey for the year 1971 also in conjunction with the census has now been completed, and the data from this survey have been used to revise the intercensal estimates from 1966 to 1970 (see previous issues of the *Canada Year Book*).

Table 17.28 shows that, over the five-year period 1967-71, direct sales by manufacturers and specialist agencies increased by nearly 12%, rising from \$719.5 million to \$805.0 million. Among the industries surveyed in 1971, the largest share of sales was accounted for by manufacturers and distributors of dairy products (20.2%); newspapers and magazines (15.6%); cosmetics (9.7%); and books (6.7%). Businesses in these four industries were responsible for more than half of all direct sales reported. The greatest growth, however, occurred primarily in the following areas: fur goods (+109.1%); magazines (+81.3%); meat, fish and poultry (+72.7%); and sail boats and pleasure craft (+49.2%).

In the 1971 direct-selling survey, information was also obtained (for the first time) on the provincial distribution of such sales. Not unexpectedly, the results were somewhat similar to the provincial distribution of "ordinary" retail sales (which are shown in brackets beside the direct-sales figures), as follows: Atlantic Provinces 6.4% (8.2%); Quebec 29.0% (25.1%); Ontario 40.2% (38.8%); Prairie Provinces 14.8% (16.0%); British Columbia 9.6% (11.9%).

Table 17.29 shows the percentage distribution of the \$805.0 million direct sales during 1971, for selected commodities, by method of distribution. Almost two thirds of this amount (\$524.7 million) was purchased at home, from home-delivery tradesmen or door-to-door canvassers: \$203.0 million for bread, milk and other dairy products, \$110.0 million for newspapers, \$75.7 million for cosmetics and costume jewellery, \$33.7 million for vacuum cleaners and other household electrical appliances, \$25.5 million for dinnerware, kitchenware and utensils, \$22.8 million for brushes, brooms and household cleaners, \$17.5 million for books, and \$36.5 million for sundry other items. Mail-order purchases by household consumers accounted for \$124.2 million, comprising chiefly books (\$35.9 million), newspaper and magazine subscriptions (\$26.1 million), phonograph records (\$14.0 million), and a wide range of electronic entertainment equipment and other leisure-time appliances offered to the credit-card holders of gasoline oil companies (\$20.0 million). Purchases from non-retail stores, e.g. sales offices or showrooms of manufacturing companies and certain primary producers, amounted to \$151.4 million and included such items as furniture repair and re-upholstery (\$32.5 million), frozen food plans (\$18.1 million), greenhouse flowers and nursery seeds (\$16.4 million), and household electrical appliances (\$12.8 million). Consumers also made \$4.7 million purchases during 1971 of meat, fish and poultry from temporary roadside market stalls, newspapers from honour boxes, and sail boats, etc., from exhibitions and shows.

Campus book stores. Since 1966, retail trade statistics have been collected from book stores located on the campuses of universities and other post-secondary educational institutions by a special supplementary annual survey. Owing to their location, their generally special method of operation and the highly seasonal nature of their business, these stores are not included in the Census of Merchandising and Service Businesses. Statistics of these book stores are required for consolidation of data on retail merchandising. Table 17.30 provides summary information on the sales of campus book stores for the last four academic years. Additional data on employment and payrolls are published in the Statistics Canada report *Campus book stores* (Catalogue No. 63-219).

17.4.2.2 Wholesale trade

Wholesalers are primarily engaged in buying merchandise for resale to retailers; to industrial, commercial, institutional and professional users; to other wholesalers; or in acting as agents in connection with such transactions.

Mixed-activity businesses (such as firms engaged both in wholesaling and retailing, contracting, service trades, manufacturing, etc.) are considered to be primarily in wholesale trade whenever they derive a larger gross margin from wholesale than from any other activity. (The gross margin is the difference between the total sales and the cost of goods sold. As the 1966 questionnaire did not seek information on the cost of goods sold, the 1961 gross margins were used for the classification of establishments.)

The delineation between wholesale and retail activity is based on the "class of buyer" criterion. If a larger share of the gross margin is obtained from sales to retailers, industrial, commercial, institutional or professional users than from sales to households or private individuals for personal use (including sales to farmers for non-farm use), the business is classified to wholesale trade. Certain businesses are considered to be in wholesale trade regardless of how their sales are broken down by the class of customer. These businesses deal in the following commodities: office furniture, lumber and building materials, farm supplies and all kinds of machinery and equipment.

Wholesale statistics measure the total volume of Canadian wholesale trade; this is the aggregate business conducted by all wholesalers operating in Canada, whether Canadian or foreign and whether sales are domestic or foreign. The total volume of trade measured by statistics is not identical with the value of goods passing through the wholesale sector of the economy: at times wholesale firms sell to each other and thus the value of the same merchandise may be recorded twice or more in the total volume of wholesale trade. No attempt is made to eliminate such duplications.

The most important part of wholesaling activity in Canada is that which is carried out by wholesale merchants. These are establishments primarily engaged in buying and selling goods on their own account. This classification includes such diverse business entities as: export and/or import merchants, cash and carry wholesalers, drop shippers or desk jobbers, mail-order wholesalers, truck distributors, rack jobbers, and voluntary group wholesalers.

The sales of wholesale merchants, as measured by a monthly reporting panel of such establishments, have been increasing consistently for several years. In 1972, they reached a new high of \$28.167 million, some 13% above the \$24.896 million recorded in 1971. Consumer goods wholesalers experienced an 11.2% increase in value of sales, compared with a 15.2% increase for wholesalers of industrial goods. The best results were recorded by wholesalers of grain, farm machinery, and construction materials and supplies; the poorest by wholesalers of footwear and coal and coke.

Table 17.31 shows the annual sales of wholesale merchants in 24 kind-of-business groupings and two residual categories during the period 1968-72. These data reflect changes in the wholesale trade series resulting from their adjustment to the 1966 Census benchmark. Further information is given in *Wholesale trade, 1966 establishments* (Catalogue No. 97-627) and *Wholesale trade, 1961-1971* (Catalogue No. 63-521).

In addition to the monthly survey of wholesale merchants, two annual surveys of wholesale trade are undertaken by Statistics Canada at the commodity level — farm implements and equipment, and construction machinery and equipment. (It should be noted that estimates of farm implement and equipment sales are also published monthly, in aggregate form, based on the data reported by a panel of major-line companies.) The results of the survey of construction machinery and equipment sales for the year 1970 were reported in the *1972 Canada Year Book*, pp. 999-1000. Later information was not available in time for this edition.

Sales of farm implements and equipment (valued at wholesale prices) rose dramatically in 1972, reaching their highest level in five years. The sales total of \$418.6 million was 28.3% higher than the comparable 1971 figure of \$326.2 million. The increase was general throughout Canada, although the Atlantic Provinces increase was considerably smaller than elsewhere. The largest percentage gains occurred in Saskatchewan, British Columbia and Ontario — 38.9, 35.4 and 26.9% respectively. Sales of repair parts, not included in Table 17.32, were \$88.7 million, 15.4% higher than the \$76.8 million sold in the previous year.

17.4.2.3 Service trades

Hotels. In addition to its annual hotel survey (Catalogue No. 63-204), Statistics Canada also reports semi-annually on the trend of hotel receipts in Canada, based on results obtained from a panel of hotels having 50 or more rooms. Table 17.33 shows that the receipts of such hotels increased by more than 32% during the 1968-72 period. The best results were experienced in Alberta and Quebec and the poorest in Manitoba and Ontario. The greatest rate of increase from 1971 to 1972 was recorded in Saskatchewan, which now appears to have reversed successfully its downward trend in the late 1960s. Other provinces where hotel receipts have risen at more than the national growth-rate during 1971-72 include British Columbia, Manitoba, Newfoundland and Prince Edward Island combined, Quebec and New Brunswick.

Restaurants. Receipts of Canadian restaurants have risen steadily over the past several years, reaching a new high of \$1,386.6 million in 1972 — an increase of more than \$220.0 million (18.9%) since 1968 (Table 17.34). The largest growth in restaurant receipts between 1968 and 1972 was experienced in Newfoundland, New Brunswick and Quebec. Declines were registered in only two provinces: Prince Edward Island (-5.2%) and Saskatchewan (-8.4%). These data include the receipts of traditional restaurants and drive-ins; they do not include such other areas of the food-serving industry as take-out restaurants, caterers, industrial restaurants and refreshment booths and stands.

Motion picture theatres. In 1970, total receipts from all motion picture theatres rose 9.1% from 1969 to an all-time high of \$128.7 million (Table 17.35). At the same time, amusement taxes collected rose 8.3% to \$9.2 million. The receipts of regular motion picture theatres increased at approximately the same rate as drive-in theatres — 9.1% and 8.9%, respectively. The rise of 2.3% in paid admissions for all types of theatres in 1970 reversed a five-year downward trend. Unlike receipts, the rise in number of admissions was considerably more pronounced in regular motion picture theatres (+2.4%) than in drive-ins (+1.6%). Despite lower employment levels in both types of theatres in 1970, salaries and wages rose to a new high of \$30.0 million, and the "average" salary increased 16.5%.

Data on Canadian motion picture production have been omitted, for this year only, from the "Service trades" section. No survey was carried out in 1971. The most recent data are for the year 1970 and appear in the 1972 *Canada Year Book*.

Film exchanges. During 1970, films were distributed by 53 companies through 112 offices located across Canada. Receipts totalled \$66.1 million, up 5.3% from 1969, and 2.3% higher than the previous record established in 1968. The industry paid \$5.3 million in salaries and wages to 737 employees in 1970 as compared to \$5.3 million paid to 846 employees the previous year (Table 17.36). Data for the National Film Board of Canada are not included.

Receipts from the rental of films rose to \$65.6 million in 1970, 6.1% higher than the \$61.8 million recorded in 1969 (Table 17.36). Revenue derived from rentals for theatrical use amounted to \$45.7 million, for television use \$18.8 million, and for other (non-theatrical) use \$1.1 million. In addition, \$53,000 was derived from the sale of advertising and \$500,000 from other sources. New films released for theatrical bookings numbered 948, of which 786 were feature films, 55 cartoons, 60 newsreels and 47 other short subjects. Of the 786 feature films, 53 originated in Canada (as compared to ten in 1969), 291 originated in the United States, 131 in Britain, 113 in Italy, 90 in France, and 108 in all other countries.

Power laundries and dry-cleaning and dyeing plants. In 1970, receipts of both power laundries and dry-cleaning and dyeing plants declined from the previous year for the first time since 1933. Receipts of power laundries declined 3.2% from 1969 to \$107.8 million while dry-cleaning and dyeing plants registered a drop of 7.5% to \$152.3 million. Employment in 1970 was down from 1968 in all categories, and salaries and wages for all firms combined dropped 7.1% from the 1969 level to \$118.8 million. The cost of materials and supplies also declined over the year, falling 13.2% from 1969 to \$23.4 million in 1970 (Table 17.37).

While dry cleaning remained the dominant revenue source for dry-cleaning and dyeing plants, rental services continued to increase, both in absolute terms and in relation to other sources of revenue, for power laundries. The \$55.5 million revenue from rental services reported by power laundries in 1970 represented 51.5% of total revenue as compared to 48.4% in 1969 and 28.0% in 1960.

The decline in revenues of power laundries and dry-cleaning and dyeing plants between 1968 and 1970 was felt in all provinces. The highest losses were recorded in Saskatchewan and New Brunswick — 12.7% and 10.3%, respectively — while Manitoba, with an almost negligible decline of 0.1%, showed the least effect of this change.

Advertising agencies. Billings of advertising agencies rose during 1970 to a new high of \$470.4 million, an increase of 3.1% from 1969. Advertising billings rose to \$462.7 million, up 2.8%, while billings for market surveys, research and other fees jumped 31.2% to \$7.6 million. Although gross revenues rose 5.1% in 1970 to \$82.9 million, net revenue reported by advertising agencies totalled only \$7.7 million, a decline of 18.3% from the record high of \$9.4 million posted in 1969 (Table 17.38).

Table 17.39 provides a breakdown of advertising billings by medium and by kind of service (media billings vs production charges) for 1969. The print and television media jointly accounted for \$367.5 million or 79.4% of total advertising billings, with radio (13.4%) and the other advertising media trailing far behind.

17.4.3 Merchandising inventories

An important function of merchandising is the exercise of control by the merchant over stocks held for resale. Seasonal variability in sales for most kinds of business is reflected in the seasonal differences in inventory holdings of marketable goods. Likewise, the expanding volume of both wholesale and retail sales is mirrored in growing levels of inventory investment. Table 17.40 is a consolidation of statistics on stocks held for resale in the retail and wholesale sectors, showing the quarter-to-quarter movement of stocks for selected categories of trade. Monthly estimates on dollar value of inventory held by wholesalers, department stores and chain stores, together with quarter-to-quarter percentage changes in sample stocks of independent retailers, are now available in a new Statistics Canada publication, *Merchandising inventories* (Catalogue No. 63-014). Stock-sales ratios, derived by dividing the dollar volume of inventories by the dollar volume of sales, are included also.

Changes in merchandising inventories between 1971 and 1972 varied over different kinds of business within the wholesale and retail sectors. In wholesale trade, in both the consumer and industrial goods categories, holdings of marketable stocks increased significantly. Department stores also experienced a strong 12.6% increase in stocks over this period, led by a 16.1% increase in stocks of furniture, TV, radio, and household appliances. In the retail chain store category, a decrease of 5.6% occurred in the grocery and other food group, while all other groups reported increases. In contrast to the other merchandising categories, the value of stocks held by independent retailers at year-end 1972 remained at precisely the same level as three months earlier. The normal seasonal decline in retail inventories following the Christmas sales period was offset by a sudden surge in stocks held by independent motor vehicle dealers during the final quarter of 1972.

17.4.4 Sales financing and consumer credit

Sales financing. A major change affecting the concept of values reported was made in the 1971 survey of sales financing in Canada. From January 1971, all values reported for paper purchases and balances outstanding were changed to a "net" basis, showing only the original amount financed and excluding all unearned income charges. This follows two important changes made in 1970. In January 1970, coverage was extended to include the sales financing done by consumer loan companies and, as well, a transfer was made of passenger cars known to be financed for commercial purposes, from the consumer goods to the commercial vehicles category. The comparability of data in 1970 and 1971 has been seriously affected by these changes.

In order to measure the effect of the last change, a special sample survey of sales finance companies was carried out for the month of December 1970. As a result, a comparison of 1970 and 1971 figures on a "net" basis was made possible. Total "net" balances outstanding of \$1,997 million in 1970 could therefore be seen to drop to \$1,943 million in 1971, a 1.7%

decrease over the year (Table 17.41). Reductions of 9.1% in holdings of passenger car paper and 10.1% in other consumer goods paper were not sufficiently offset by the 6.3% increase in commercial vehicle balances and the 5.5% increase in other commercial finance paper balances. The lowered volume of sales financing for a second consecutive year reflected the changing portfolio of sales finance and consumer loan companies toward greater financing of commercial and industrial goods.

By December 1972, however, the marked decline in consumer goods balances (noted in 1970 and 1971) was significantly reversed. An increased volume of paper purchased in 1972 produced a 16.2% rise in the balances outstanding for consumer goods over year-end 1971. Commercial goods paper also showed a brisk upsurge in volume purchased, raising outstanding balances by 16.4% during this period. The strongest growth in 1972 occurred in the financing of "other commercial goods", which rose by 16.7% in balances outstanding. Passenger car financing, which had been declining during the preceding two years, surged to a 19.3% increase over the 1971 total.

Consumer credit. Although the total volume of credit extended to consumers by retail stores and selected financial institutions has grown progressively over the past 20 years, annual rates of increase have shown a tendency to decline during periods of credit restraint and weakness in buyer demand. During the 1961-69 period, the annual rate of increase in balances outstanding averaged 12.5%. In 1970, however, balances rose by only 5.1% — the smallest gain since 1957 — reflecting not only a reduced rate of credit expansion but also a statistical adjustment that resulted in the transfer of passenger cars used for commercial purposes (paper valued at \$182.3 million) into non-consumer financing. In 1971, advances in total credit balances were again restrained but had recovered somewhat to produce an 8.3% increase over 1970. (The actual rate of increase was 9.6%; the lower published figure resulted from a change in valuation in the

instalment financing of consumer goods, from a gross basis to one which was net of unearned finance charges.) A buoyant economy during 1972 pushed total consumer credit balances to a record level of \$14,870 million by year-end — 17.2% higher than the 1971 figure (Table 17.42).

While total credit volume has been expanding, the composition of consumer credit balances has been undergoing continual change. Chartered banks have been by far the most active financial institutions in this sphere of financing, increasing their share of total consumer credit holdings from 40.0% in 1970, to 45.7% in 1971 and 48.2% in 1972. At the same time, consumer loan and sales finance companies — whose holdings of consumer instalment credit and personal cash loans had declined by 19.9% in 1971 — experienced an 8.1% increase in balances for 1972. Their share of total consumer credit, however, continued to decline, from 24.4% in 1970 to 17.9% in 1972. Credit unions and caisses populaires, on the other hand, extended their share of consumer credit to 13.5% at year-end 1972, increasing their balances outstanding by 18.3% over 1971. During the same period, retail store credit, public utilities' credit and balances held by other credit-card issuers all rose in amounts outstanding, but with no change in their share of total consumer credit balances.

Retail credit. Retail credit is defined as the value of accounts outstanding on the books of Canadian retailers, including department stores and their "captive" acceptance companies, adjusted to exclude non-consumer credit accounts. During 1972, total retail credit outstanding rose by 10.1% — somewhat less than the 10.7% increase in retail sales over the same period (Table 17.43). Department stores, which held a 46.2% share of the retail credit sector by year-end, contributed a 9.1% increase in credit balances during 1972 (while their sales increased by 15.3%). Balances held by furniture, TV, radio and appliance stores rose, for the second consecutive year, to \$186.6 million as the result of a significant increase of 16.6% during 1972. On the whole, however, the proportion of consumer credit accounted for by retail stores continued to fall steadily to 12.0% at the end of 1972 despite vigorous growth in the accounts receivable of fuel dealers, men's clothing stores, grocery stores, and the automotive group.

17.5 Co-operative organizations

Business volume of Canadian co-operatives rose in 1970 for the first time since 1967 with a turnaround in grain exports which had slumped badly in the previous two years and offset gains in most of the other sectors. Gross volume was \$2,179 million for a gain of \$87 million or about 4%. Revenue broken down by the four broad components of co-operative business was: farm product marketings \$1,354.3 million representing a gain of 10%; sales of merchandise and supplies \$748.8 million, an increase of 3%; revenue from services (trucking, cold storage, seed cleaning, etc.) \$59.9 million, a decrease of 10%; and miscellaneous income (rent, interest, dividends, etc.) \$16.2 million, almost unchanged from the previous year.

Business co-operatives (as opposed to such non-commercial co-operatives as community halls and rinks, etc.) are classified by their primary function into four main groups: marketing and purchasing (by far the largest group), service, fishermen's and wholesale. The first three groups are known as "local" co-operatives since they deal directly with individual members; the wholesale co-operatives, as their name indicates, perform wholesaling functions for the locals. Revenues of the wholesale co-operatives are usually presented separately from those of the locals since their sales are mostly a duplication of the locals' sales. Assets of the locals at \$1,240.9 million were down for the year with a drop in the value of grain inventories in the Prairie Provinces nullifying the increases which were experienced elsewhere. The number of business co-operatives increased in 1970 for the first time in many years led by Quebec and Alberta with new incorporations, mainly in the service group. Membership in co-operatives stood at 1,735,000 for 1970 a gain of about 45,000 over the previous year. All provinces except Ontario contributed to the increase.

Total business volume of marketing and purchasing co-operatives recorded a gain of \$78.8 million or 4% for 1970 (Table 17.44) with farm product marketings, supply sales, service revenue, and other income all showing an increase. On a geographic basis only New Brunswick and the interprovincials were down for the year. Assets of the marketing and purchasing co-operatives declined by \$25 million during the year due to the drop in grain inventory values and a retrenchment in property and equipment investment. The number of co-operatives declined again in 1970 as it has for a number of years. Membership rose on the strength of gains in Quebec, Alberta and British Columbia. Farm product marketings by marketing and

purchasing co-operatives rose to \$1,288.4 million made possible by the modest improvement in the western grain situation (Table 17.45). Dairy product marketings continued an upward trend into 1970. Fruit and vegetable marketings slipped almost 10% during the year, led by British Columbia but also including Ontario, Quebec and New Brunswick. The apple crop in British Columbia was satisfactory but production of tender tree and soft fruits was hard hit by extensive winter frost damage. Nova Scotia fruit and vegetable marketings rose on the strength of a good apple crop, as did those of Alberta and Prince Edward Island with better returns from potatoes. Livestock marketings rose on good gains in Saskatchewan, British Columbia and Nova Scotia. Poultry and eggs moved slightly up, with a good gain in Quebec countering declines in some other areas. Miscellaneous marketings eased down about 4%. Maple products climbed about 10% while honey and tobacco sales slumped. Supply sales of marketing and purchasing co-operatives advanced \$22 million or 3% for the year despite the fact that cash receipts to Canadian farmers declined almost 2% in the period. However, total supply sales represented a mixture of two different trends: sales in the Prairie Provinces (including the interprovincials) were unchanged, while sales in the other provinces taken as a group, made a very comfortable gain of nearly 6%. Although poor economic conditions affected all supply sales in the Prairie Provinces, fertilizer and machinery were the only categories which had major declines. Fertilizer sales continued on a downward trend started in the previous year reflecting a combination of depressed prices caused by overcapacity in the industry and lower demand by farmers suffering from lower grain shipments and thus reduced incomes. The effect of economic conditions on farm machinery sales was extremely harsh with farmers cutting their purchases drastically.

Business volume of the service co-operatives expanded by about 8% in 1970 to \$70.5 million and consisted of service revenue \$30.9 million, marketing of farm products and sale of supplies \$37.8 million, and miscellaneous income \$1.8 million. The rise in business volume was led by the feeder co-operatives in Alberta and Saskatchewan where more and more farmers turned to cattle feeding as a means of marketing their grain. An added impetus to feeding was provided in Alberta through the introduction of new regulations under their feeder loan legislation which permit larger borrowings by individual farmer-feeders. Quebec wood-cutting co-operatives turned in another year of increased volume. The business of medical insurance co-operatives declined for the second consecutive year with reduced coverage in British Columbia and Ontario as the result of changes in medical care legislation in the two provinces. Natural gas co-operatives in Alberta experienced another year of growth while rural electric co-operatives levelled off after a long period of expansion. Service revenues in New Brunswick picked up on the first full year's operation of a large housing co-operative. Assets of the service co-operatives rose 9% in the year to \$156.5 million. Membership at 296,000 and number of co-operatives at 1,103 also represented gains over the previous year. Business volume of fishermen's co-operatives rose about \$2.0 million or 6% for 1970. All provinces were on the uptrend except British Columbia which suffered a mild decline as a result of rising prices not quite making up for a decrease in production. Asset values of the fishermen's co-operatives at \$18.0 million were virtually unchanged from the preceding year as were the number of associations reporting and reported membership.

Wholesale business volume advanced \$30.0 million or 5% for the year with almost all of the increase occurring in supply sales led by food products and feed, while marketings were little changed from the previous year. Food sales were boosted by large gains in Quebec while feed sales reflected an increase in the sale of western feed grains in central Canada which suffered a crop reduction. Fertilizer sales were unchanged, a continued decline in the Prairie Provinces matching increases in other areas. Building material sagged with the general slump in construction activity in the West. Petroleum sales were up substantially, paced by large gains in Quebec where special emphasis has been placed on accommodating the continuing population shift from rural to urban areas. Hardware and machinery sales made good gains in eastern Canada while clothing and home furnishings, and miscellaneous sales were moderately ahead in most areas. On the marketing side poultry and eggs were hit by a sharp drop in broiler chicken prices, while livestock volume was unchanged with a bad year in Quebec offsetting gains in Ontario and the Maritimes. The number of wholesale co-operatives declined by one in 1970 when the British Columbia Co-operative Wholesale Society was merged with Federated Co-operatives Limited. Assets of the wholesales at year-end 1970 totalled \$235.2 million, an increase of \$13.0 million or 6% during the period.

17.6 Government aid and controls

17.6.1 The Department of Consumer and Corporate Affairs

The functions of the Department relate to consumer affairs; corporations and corporate securities; combines, mergers, monopolies and restraint of trade; bankruptcy and insolvency; patents, copyrights and trade marks.

The Department has five main divisions — the Bureau of Consumer Affairs, the Bureau of Corporate Affairs, the Bureau of Intellectual Property, the Bureau of Field Operations and the Office of the Director of Investigation and Research under the Combines Investigation Act. The Bureau of Consumer Affairs co-ordinates government activities in the field of consumer affairs. Branches within the Bureau include Consumer Services, Consumer Research and Consumer Standards. The Bureau of Corporate Affairs administers legislation and regulations pertaining to corporations. Its branches include Corporations, Bankruptcy, Securities and Research. The Bureau of Intellectual Property administers laws pertaining to patents, copyright and industrial design, and trade marks, with a branch responsible for each of these three fields. The Bureau of Field Operations supervises the Department's operations across Canada, staffing regional offices in Vancouver, Winnipeg, Toronto, Montreal and Halifax and district offices in 22 other cities. They ensure that laws and regulations administered by the Department are uniformly applied and interpreted in all parts of the country. The field force includes consumer consultants and information officers in each region, complaints officers, inspectors and specialists in the fields of bankruptcy and false and misleading advertising.

The Office of the Director of Investigation and Research, Combines Investigation Act, has four branches, specializing in Combinations, Mergers and Monopolies, Trade Practices and Research. The Restrictive Trade Practice Commission (Combines Investigation Act) is also in the Department and reports directly to the Minister.

Anti-combines legislation. Canadian anti-combines legislation seeks to eliminate restrictive trade practices in order to stimulate maximum production, distribution and employment through open competition. Legislative measures, including some formerly included in the Criminal Code, were amended in 1960 and consolidated into the Combines Investigation Act (RSC 1970, c.C-23).

In general terms, the Combines Investigation Act makes illegal the operation of combines that prevent, or lessen "unduly", competition in production, manufacture, purchase, barter, sale, storage, rental, transportation or supply of an article of trade or commerce or in the price of insurance. Although the exchange of statistics or defining of product standards are not to be construed as illegal practices, this exemption is no longer valid if the purpose of the exchange of information is to reduce the possibility of increased competition in the fields of prices, production quantities or quality, customers, markets or distribution channels, or if it has the effect of restricting entry or expansion into that particular business, trade or industry. While combines which relate to export trade only are generally exempt from these constraints imposed by the Act, any such arrangement that may have an adverse effect on the volume of export trade or on the businesses of Canadian competitors or domestic consumers is still subject to prosecution.

Under the Act it is illegal to participate in a merger or a monopoly that effectively operates to the detriment of the public interest or that lessens competition.

Price discrimination and "predatory price cutting" are treated very explicitly in the Act. No supplier may make a practice of discriminating among his competing trade customers by offering more advantageous prices to one over another. Under the law, if a second buyer is willing to buy on the same terms and in the same quantities, he must be given the same price. Prices established by a supplier cannot be set lower in one locality than another, or unreasonably low anywhere, if the policy is designed to eliminate or lessen competition or has that effect.

Advertising or display allowances to competing trade customers must be granted in proportion to their purchases and any expenses required to be incurred by customers must also be in proportion to their purchases. No service may be exacted in return for allowances unless all different types of customers are able to perform that service.

Other sections of the Act forbid misleading or deceptive advertising, either as to normal price or as to presumably factual statements describing goods or property offered for sale.

The "resale price maintenance" clause of the Act is possibly one of the most explicit in the field of restrictive practices. The suggested list price for goods offered for resale at the wholesale or retail level can be only that — a suggested price. No supplier of goods for resale may prescribe the final price at which the goods must be sold, nor can he cut off supplies if a merchant refuses to abide by the suggested prices. Some relief to the supplier is offered by the qualifications that no one can be automatically considered to have practised resale price maintenance if the goods are withheld because there is sound reason to believe that the merchant was making a practice of using the products of the supplier as "loss-leaders" or as bait advertising, or engaging in misleading advertising or failing to provide the service that the final purchaser had a right to expect.

The Director of Investigation and Research is responsible for investigating combines and other restrictive practices, and the Restrictive Trade Practices Commission is responsible for appraising the evidence submitted to it by the Director and the parties under investigation, and for making a report to the Minister of Consumer and Corporate Affairs. When there are reasonable grounds for believing that a forbidden practice is engaged in, the Director may obtain from the Commission authorization to examine witnesses, search premises, or require written returns. After examining all the information available, if the Director believes that it proves the existence of a forbidden practice, he submits a statement of the evidence to the Commission and to the parties believed to be responsible for the practice. The Commission then sets a time and place for a hearing at which both sides are represented. The Commission prepares and submits a report to the Minister of Consumer and Corporate Affairs; such reports are ordinarily required to be published within 30 days.

Under the provisions of the Act, general inquiries may be made into restraints of trade which, although not forbidden or punishable, may affect the public interest. The courts, including the Federal Court of Canada, in addition to imposing punishment for a contravention of the legislation, may issue an order restraining persons from further contravention or directing the dissolution of a merger or monopoly as the case may be. Application also may be made to the courts for such an order in lieu of prosecuting and convicting for a contravention of the legislation. Prosecutions for offences against the substantive provisions of the legislation (other than the section dealing with price misrepresentation which is punishable only on summary conviction) may be taken either in the provincial courts or with the consent of the accused in the Federal Court of Canada.

Nine reports of inquiries under the legislation were published between January 1, 1968 and June 30, 1971 and are listed in the 1972 *Canada Year Book*. Since then the report of inquiry into draught beer in Metropolitan Toronto has become available. Copies of all reports are available from Information Canada or the Office of the Director of Investigation and Research.

On June 29, 1971, the Minister of Consumer and Corporate Affairs introduced Bill C-256 to replace the Combines Investigation Act with a new Competition Act. The Bill embodied many of the basic suggestions made in the Report of the Economic Council in July 1969. It was introduced to enable members of Parliament and interested individuals, corporations and associations to study and comment on it. The Bill, as presented, was allowed to expire on the Parliamentary Order Paper. It is expected that a number of the recommendations received will be incorporated in a revised Competition Bill.

Patents. Patents for inventions are issued under the provisions of the Patent Act (RSC 1970, c.P-4) and Patent Regulations have been proclaimed to carry into effect the objectives of the Act. Applications for patents for inventions and requests for information about such patents should be addressed to the Commissioner of Patents, Bureau of Intellectual Property, Department of Consumer and Corporate Affairs.

In the year ended March 31, 1972, 29,242 patents were granted. Of these, 5.4% resulted from inventions made by residents of Canada, 6.9% by residents of the United Kingdom and 61.6% by residents of the United States.

Printed copies of Canadian patents issued from January 1, 1948 to date are available at \$1 each. The *Patent Office Record*, issued weekly, contains a list of patents issued during the week covered, information about services in the Patent Office and information of concern to the patent profession.

Canadian and foreign patents may be consulted at the Patent Office Library. British

patents and abridged specifications thereof from 1617 to date and United States patents from 1845 to date are available, as well as many patents, indexes, journals and reports from Australia, India, Ireland, New Zealand, Pakistan, South Africa, Austria, Belgium, Colombia, Czechoslovakia, Egypt, France, Federal Republic of Germany, Italy, Japan, Mexico, the Netherlands, Norway, Sweden, Switzerland and Yugoslavia. A list of the foreign patents available is published in the Patent Office Record.

Copyrights, industrial designs and timber marks. Copyright protection is governed by the Copyright Act (RSC 1970, c.C-30) in force since 1924. Protection is automatic without any formality, although a system of voluntary registration is provided. Application for registration should be addressed to the Commissioner of Patents, Ottawa.

The Act sets out the qualifications for a copyright and its duration: "Copyrights shall subsist in Canada...in every original literary, dramatic, musical and artistic work, if the author was, at the date of the making of the work, a British subject, a citizen or subject of a foreign country which has adhered to the Berne Convention and the additional Protocol...or resident within Her Majesty's Dominions. The term for which the copyright shall subsist shall, except as otherwise expressly provided by this Act, be the life of the author and a period of fifty years after his death."

Canada belongs to the Universal Copyright Convention. This means that the works of Canadian authors are protected in the United States without formality of compulsory registration or the obligation of printing in the United States, provided that, from the first publication, the work bears in a prominent place the copyright symbol, followed by the name of the proprietor and the year of publication.

Copyright protection is extended to records, perforated rolls, cinematographic films, and other contrivances by means of which a work may be mechanically performed. The intention of the Act is to enable Canadian authors to obtain full copyright protection in Canada, in all parts of the Commonwealth, in foreign countries of the Copyright Union and in the United States. Protection of industrial designs and of timber marks is afforded under the Industrial Design and Union Label Act and the Timber Marking Act. Registers of such designs and marks are kept by the Copyright Branch of the Patent Office.

Copyrights registered during the year ended March 31, 1972 numbered 10,072; in addition 1,456 industrial designs were registered.

Trade marks. The Trade Marks Office, a Branch within the Bureau of Intellectual Property, administers the Trade Marks Act (RSC 1970, c.T-10) which covers all legislation concerning the registration and use of trade marks and supersedes from July 1, 1954, former legislation enacted under the Unfair Competition Act, the Union Label Act and the Shop Cards Registration Act. Correspondence relating to an application for registration of a trade mark should be addressed to the Registrar of Trade Marks, Ottawa.

Applications are advertised for opposition purposes in the *Trade Marks Journal*, a weekly publication that also gives particulars of every registration of a trade mark and every registration of a registered user. The required fee payable on application for registration of a trade mark is \$35, for advertisement of an application \$25 and for registration of a person as a registered user of a trade mark \$35.

Trade marks registered during the year ended March 31, 1972 numbered 7,200 compared with 6,897 for the year before; renewals totalled 3,435.

17.6.2 Trade standards

17.6.2.1 The Standards Council of Canada

The Standards Council of Canada acts as a national co-ordinating institution through which organizations concerned with voluntary standardization may co-operate in recognizing, establishing and improving standards in Canada and develop a broader and more energetic Canadian standards program to meet both national and international responsibilities. Its structure is intentionally designed to make maximum use of organizations already functioning efficiently in order to broaden and co-ordinate the total range of activities to obtain a more complete coverage of standards needs.

The objectives of the Council are to foster and promote voluntary standardization in fields relating to the construction, manufacture, production, quality, performance and safety of buildings, structures, manufactured articles and products and other goods, including

components, not expressly provided for elsewhere by law, to advance the national economy, benefit the health, safety and welfare of the public, assist and protect consumers, facilitate domestic and international trade and further international co-operation in the field of standards. The Council is responsible for co-ordinating the planning and execution of a program for the development of standards in the metric (SI) system. This activity is in support of the over-all program which is being prepared by the Preparatory Commission for Conversion to the Metric System.

The Council consists of not more than 57 members, headed by a president and a vice-president. The seats of the Council, other than the 16 assigned to government representatives (six federal and ten provincial), will be occupied by representatives of national organizations. Membership will be broadly representative of all levels of government (federal, provincial and municipal), primary and secondary industries, distributive and service industries, trade associations, labour unions, consumer associations and the academic community. Members employed in the Public Service of Canada hold office during pleasure. Other members are appointed for a term not exceeding three years. The day-to-day work is carried out by a permanent staff in Ottawa, headed by an executive director who is appointed by the Governor in Council.

17.6.2.2 Trade standards and regulations

In its consumer program, the Department of Consumer and Corporate Affairs is responsible for the administration of broad legislation which affects the business community. Policies and programming are determined by the Standards Branch, and the necessary field supervision by the Operations Branch.

Hazardous products. General regulations issued under the Hazardous Products Act provide for the banning or the regulated sale of a variety of dangerous products which are toxic, flammable, explosive, or corrosive. These relate largely to household products. Toy regulations are directed to eliminating dangerous toys.

General commodity field. The National Trade Mark and True Labelling Act provides a framework for the development of National Standards and true labelling in order to prevent deception in labelling and advertising. The Garment Sizing Regulations were developed as a National Standard for the sizing of children's garments. The labelling provision has been used for regulation for fur garments, watch jewels, textiles, etc. Textiles are subject to special new requirements established under a Textile Labelling Act passed in 1970.

Control of marking of previous metal articles is maintained under the Precious Metals Marking Act. This Act will shortly be replaced by a revised statute passed by Parliament.

In the packaging and labelling field, a Packaging and Labelling Act has been passed by Parliament which, when proclaimed, will give uniformity to packaging practices in Canada, reduce packaging and advertising deception, and control proliferation.

Food. In areas of health, grading, standards and composition, the Food and Drug Act, the Canadian Agricultural Products Standards Act and the Fish Inspection Act are generally applicable. The Consumer and Corporate Affairs Department is charged with administration of the economic fraud aspects in distribution. This responsibility relates mainly to labelling and advertising in any segment of the news media.

Advertising. Most legislation has particular requirements to ensure against misleading advertising, but Sections 36 and 37 of the Combines Investigation Act are especially noteworthy as they include general provisions against misleading advertising practices.

Measurement. The Weights and Measures Act prescribes the legal standards of weight and measure for use in Canada, it also requires control of the type of all weighing and measuring devices used for commercial purposes and their periodic verification and surveillance directed toward the elimination of device-tampering and short-weight sales. A replacing Act has been passed by Parliament and will be proclaimed with the issue of new regulations. The fundamental objectives of existing legislation are unchanged. The new Act is an updating, and complements the proposed packaging and labelling legislation.

The Electricity Inspection Act and the Gas Inspection Act control the approval before sale and use of devices used for metering or otherwise billing for sales of electricity and gas; they also provide a framework for continual in-use inspection.

17.6.3 Control and sale of alcoholic beverages

The retail sale of alcoholic beverages in Canada is controlled by provincial and territorial government liquor control authorities. Alcoholic beverages are sold directly by most of these liquor control authorities to the consumer or to licensees for resale. However, in some provinces, beer and wine are sold directly by breweries and wineries to consumers or to licensees for resale. During the year ended March 31, 1971, provincial government liquor authorities operated 1,269 retail stores and had 255 agencies in smaller centres of population.

Government revenue specifically related to alcoholic beverages and details of sales by value and volume for each province are given in Table 17.46. Statistics Canada report, *The control and sale of alcoholic beverages in Canada* (Catalogue No. 63-202) shows further detail as well as volume figures of production and warehousing transactions, the value and volume of imports and exports and the assets and liabilities of provincial liquor commissions.

Table 17.47 shows the value and volume of sales of alcoholic beverages in the years ended March 31, 1970 and 1971. It should be noted that the value does not always represent the final retail selling price of alcoholic beverages to the consumer because, when sold to licensees, only the selling price to licensees is known. Volume of sales is a more realistic indicator of trends in consumption although, as a measure of personal consumption by Canadians, it is subject to the same limitations as the figures of value sales and includes, in addition, purchases by non-residents.

17.7 Bankruptcies and commercial failures

Two series of figures are included here which, although closely related as far as subject matter is concerned, cover different aspects of the field of bankruptcies and commercial failures. The first is limited to the supervision, by the Superintendent of Bankruptcy, of the administration of bankrupt estates under the Bankruptcy Act (RSC 1970, c.B-3); it gives information on the amounts realized from the assets as established by debtors and indicates that values actually paid to creditors are invariably very much lower than such estimates alone would imply. It can therefore be assumed that this applies in even greater degree to the more extended fields covered in the second section, compiled by Statistics Canada, which is limited to bankruptcies and insolvencies made under federal legislation and includes business failures only.

Administration of bankrupt estates. The Bankruptcy Act was last revised in 1949 and amended in 1966. The amendments were instigated by exposures and suggestions of illegal and improper practices in connection with bankruptcy proceedings or administration. They do not constitute a complete revision of the Bankruptcy Act but were designed to provide, as an interim measure, remedies to the most urgent areas of complaints. They provide the Superintendent of Bankruptcy with direct and immediate authority in the field of investigation and inquiry, and tighten the procedures and requirements in a number of areas, such as that of proposals which an insolvent person may make to his creditors. In other words, these amendments were intended to provide remedies in situations where it had been shown by experience that abuses of the bankruptcy process are most likely to occur. The amendments also contain a new Part X entitled "The Orderly Payment of Debts" which may be brought into force in any province at the request of the provincial authorities concerned. Six areas have taken advantage of this part of the legislation: Alberta on April 17, 1967, Manitoba on June 1, 1967, Saskatchewan on April 1, 1969, British Columbia on June 1, 1970, Nova Scotia on July 1, 1970, Prince Edward Island in April 1971 and the Northwest Territories in November 1972.

A new program called the Small Debtor Program was instituted in June 1972. While it is not an amendment to the Bankruptcy Act, it authorizes federal employees who have been appointed as trustees to handle the estates of certain wage earners who cannot obtain the services of a private trustee.

A report issued annually by the Superintendent of Bankruptcy gives statistics and comments on various activities in the field of bankruptcy, such as prosecution for offences, issue of licences for trustees in bankruptcy, number of estates reported and closed during the year, and costs of bankruptcy administration in Canada. These data are summarized in Table 17.48.

Returns under the Bankruptcy and Winding-up Acts. Statistics Canada data on bankruptcies and insolvencies cover only failures coming under the federal Bankruptcy Act and the

Winding-up Act. Figures cover business failures only. Table 17.49 gives yearly comparisons of liabilities — as estimated by debtors — for the main regions of the country. Table 17.50 shows the number of bankruptcies and insolvencies by industry and economic area for 1971.

¹ Cannot be reported separately for manufacturing and non-manufacturing activities but related substantially to manufacturing activity.

² Includes production and related workers, administrative and office employees, sales, distribution and other employees; excludes working owners and partners.

³ Includes supplies used in both manufacturing and non-manufacturing activity.

⁴ Includes shipments of goods of own manufacture, value of shipments of goods purchased for resale and other operational revenue.

⁵ Value of total operational revenue less total cost of materials, supplies, fuel and electricity used and goods purchased for resale in the same condition; all adjusted for inventory changes where required.

17.5 Summary statistics¹ of manufactures, by industry group, 1969 and 1970

Chapter 18

International trade

18.1 Federal trade services

Canada's economy continues to be vitally dependent on international trade. Competition among industrial nations is intense and increased exports are not easy to achieve. A successful export trade can only be assured by combining good products, efficient production and aggressive, intelligent marketing with government support.

Federal government support is provided through the Department of Industry, Trade and Commerce and the Export Development Corporation. The Department assists Canadian industry throughout the complete cycle — from research, design and development through production to marketing of the finished product. The Export Development Corporation, a Crown agency which reports to Parliament through the Minister of Industry, Trade and Commerce, provides insurance, guarantees, loans and other financial facilities to help Canadian exporters.

18.1.1 Department of Industry, Trade and Commerce

Departmental units involved in international trade are: Office of General Relations, Office of Special Import Policy, Export and Import Permits Branch, the International Bureaux, Trade Commissioner Service, Office of International Special Projects, Financing and Aid Branch, Grain Marketing Office, Transportation Services Branch, Fairs and Missions Branch, and the Program Office (Export Market Development), which handles the administration of the Program for Export Market Development.

The Office of General Relations includes a General Trade Policy Branch and a Commodity Trade Policy Branch, responsible, within the Department, for formulating and implementing Canadian external trade policy with particular reference to the activities of the General Agreement on Tariffs and Trade (GATT), the Organization for Economic Co-operation and Development (OECD) and the United Nations Conference on Trade and Development (UNCTAD). It is also responsible for the preparation and conduct of negotiations of intergovernmental commodity agreements, such as those for wheat, coffee and sugar.

The Office of Special Import Policy proposes action to be taken by government in the light of recommendations of the Textile and Clothing Board (with respect to imports of textiles and clothing) and of the Anti-dumping Tribunal (with respect to other "low-cost" products), as well as in other instances where "low-cost" imports have caused or are threatening serious injury to domestic production. It conducts export restraint negotiations with other governments and is responsible for Canadian input into international activities relating to textiles, i.e., under the GATT and the Arrangement Regarding International Trade in Cotton Textiles.

The Export and Import Permits Branch administers the federal Export and Import Permits Act. The intention of the Act is to ensure, by means of export controls, that there is an adequate supply and distribution in Canada of goods necessary for defence or other purposes; that no specified goods having a strategic nature will be made available to any destination wherein their use might be detrimental to the security of Canada; and to implement an intergovernmental arrangement or commitment. Also, by means of import controls, the Act is intended to ensure an adequate supply in Canada of goods that are scarce in world markets, or subject to governmental controls in the countries of origin or to allocation by intergovernmental arrangement; to implement action taken under certain other federal Acts to support the price or have the effect of supporting the price of specified goods; and to implement an intergovernmental arrangement or commitment. Other functions of this Branch are to advise exporters and importers on interpretation and requirements of the Export Control and Import Control Lists and Regulations; to study the economic implications of the Act; and to review Control Lists and practices.

The International Bureaux (European Bureau, Pacific, Asia and Africa Bureau, and Western Hemisphere Bureau) provide the central departmental points of contact on matters affecting Canada's trade and economic relations with other countries and areas. The Bureaux are

centralized sources of information on Canada's trade with specific countries or regions and they provide a regional perspective for matters of both international trade relations and export trade development. Their responsibilities include: developing Canada's international trade strategy and programs for individual countries and areas; maintaining and improving access for Canadian products to export markets through negotiation of trade agreements with other countries and consulting on trade relations and trade problems at the official level with foreign governments. They also provide information, advice and guidelines to government agencies and to the business community on foreign governments' trade and economic regulations and practices; maintain contact, normally through Canadian posts abroad, with foreign markets and foreign governments on matters pertaining to markets for Canadian exports; and provide advice to the Department, to other Canadian government agencies and to the Canadian business community on export market problems and opportunities.

The Trade Commissioner Service has 82 trade offices in 57 different countries. Its primary role is to promote Canada's export trade and generally to protect its commercial interests abroad. Accordingly, a trade commissioner is called upon to perform a wide variety of tasks: to act as an export marketing consultant; to bring foreign buyers into contact with Canadian sellers; to help organize trade fairs and trade missions in his territory; to recommend modes of distribution and suitable agents; and to keep headquarters informed of changes in tariffs, exchange controls and other matters that might affect Canada's trade with the country to which he is assigned. He initiates programs to develop markets for those products with the greatest potential in given areas, handles inquiries from Canadian firms and provides personal assistance to the Canadian exporter in his territory. In addition, he acts on behalf of the foreign programs of a number of federal government departments and undertakes agricultural reporting at specified posts. For a Canadian firm wishing to develop a market in his territory, the trade commissioner can supply information on product usage, if any, in that territory, on local production and import data for the product and on prospective users and/or agents for it.

The scheduled return of trade commissioners for official tours of Canada is an effective means of informing Canadian firms interested in export trade, and trade associations are informed well in advance of these visits so that appointments can be arranged for discussion of problems with firms interested in exporting to his territory. Businessmen wishing to interview any trade commissioner on tour may arrange to do so by communicating with the Trade Commissioner Service, the Canadian Manufacturers' Association, the local Chamber of Commerce or Board of Trade, or one of the Department's regional offices.

The Office of International Special Projects consists of two Branches: the Defence Programs Branch and the Special Projects Branch, which develop certain types of special export opportunities by promoting Canadian industrial participation in projects and programs abroad. Many of these export opportunities are capital projects requiring goods and services from several sources of supply, no one of which can normally undertake the lead in exploiting such a project. This Office attempts to provide the special government assistance needed to co-ordinate the efforts of all concerned.

The Defence Programs Branch promotes defence export trade through marketing programs aimed at the sale of Canadian defence and defence-related high-technology equipment to friendly countries, and the establishment of arrangements with Canada's allies for co-operative defence industrial research, development and production. A major activity is the Canada - United States defence-development and production-sharing program, which entails the joint development and reciprocal procurement of defence items.

The Special Projects Branch identifies and exploits opportunities for capital projects abroad having multi-industry content, including those related to airports, tourism, education, health care and pollution abatement; provides marketing assistance to service industries, particularly providing a focal point in the Department for consulting engineers; and co-ordinates departmental marketing activities in the promotion of Canadian participation in projects financed by multilateral and bilateral aid sources such as the World Bank and regional development banks.

The Financing and Aid Branch participates in the development of policies and procedures for external aid, export credits and other export financing arrangements. In addition, it keeps Canadian exporters informed about the range of financing facilities provided by the Canadian government and those available through international financial institutions.

The Grain Marketing Office consolidates the Department's operational and market development activities for grains and oilseeds and their products, and works closely with the Grains Group and the Canadian Wheat Board in a continuing review of grain policies and programs. It follows developments in grain markets and sales opportunities and maintains a comprehensive program of market development and sales promotion.

The Transportation Services Branch is concerned with the transportation environment and with short- and long-term transportation problems that affect Canadian trade and industrial development. Continuing reviews are made of freight rates and services to shippers, and of regional, national and international transportation policies and measures that have an impact on Canadian trade, and assistance is provided to shippers in selecting appropriate transportation routes and modes at lowest possible freight costs. The Branch participates in national and international organizations and conferences concerned with cargo movement, intermodal transport, simplification of documentation and facilitation of trade procedures, and international maritime development.

The Fairs and Missions Branch formulates the departmental program of trade promotions and plans, organizes and manages individual promotional events designed to stimulate the sale of Canadian products and services abroad. The range of its activities includes participating in international trade fairs, solo shows and in-store promotions, and organizing technical seminars and trade missions to and from Canada. Fairs abroad display Canadian products and expertise covering a broad spectrum from electronics and computer equipment to frozen foods; from ocean technology to Canadian styles in clothing and footwear; and from wood products to cattle. The Department provides promotional publicity and a highly organized and specially designed exhibit setting.

Missions and technical seminars vary in type depending on the objective but, in general, out-going missions are used for market investigation and evaluation and identification of technical market access problems, while incoming missions are designed to invite foreign government or company representatives, who can influence buying, to inspect the industrial capacity and technical capabilities of Canadian firms and the products and services they can supply. Technical seminars are used to acquaint potential buyers with Canadian expertise and technology in specific fields.

The Fairs and Missions program includes planned provision to take advantage, at short notice, of foreign market opportunities which cannot be foreseen: these include the Incoming Trade Delegates and Buyers Program and the Export Oriented Training Program.

18.1.2 Office of Tourism

The Office of Tourism comprises the Canadian Government Travel Bureau and the Travel Industry Branch. The Bureau is charged with promoting domestic travel and travel to Canada from other countries; the Branch is concerned with ensuring that the various sectors of the Canadian travel industry – the facilities, services and attractions – make the best possible contribution to tourism activity.

To accomplish its primary function of encouraging Canadians to "Explore Canada" and of attracting visitors to Canada, the Canadian Government Travel Bureau undertakes extensive tourist advertising and promotion campaigns in Canada and abroad, and provides tourist publicity material for newspapers, magazines, radio and television, and film outlets. It works closely with travel agents and tour operators on three continents and maintains an extensive travel counselling service, providing brochures and information to about seven million potential visitors annually. Offices are operated in New York, Chicago, San Francisco, Minneapolis, Los Angeles, Boston, Philadelphia, Cincinnati, Buffalo, Cleveland, Detroit, Washington, Pittsburgh, Atlanta and Seattle in the United States; and in London, Paris, Frankfurt, The Hague, Mexico City, Tokyo and Sydney.

The Travel Industry Branch is concerned primarily with the "supply" side of Canadian tourism. Its duties entail close examination of the nature and extent of tourist facilities and services in Canada and appraisal of their adequacy to meet visitor expectations; study of federal, provincial and private programs and policies related to the growth and development of the travel industry; assessment of industry strengths, weaknesses and problems; and preparation of advice to the Minister on ways and means to improve the facilities, services and attractions of the various sectors of the industry. Close liaison is maintained with federal and provincial departments and agencies having activities related to travel and tourism and with

major elements of the private sector of the Canadian travel industry. The Branch also keeps under review the tourism and travel policies and practices of other countries, studies trends and developments in international tourism, and concerns itself with the activities of international organizations and agencies that affect Canada's travel industry.

18.1.3 Export Development Corporation

The EDC is a Crown corporation empowered by federal statute to insure Canadian firms against non-payment when Canadian goods and services are sold abroad; to make loans to foreign purchasers of Canadian capital equipment and technical services; to guarantee financial institutions against loss when they are involved in an export transaction by financing either the Canadian supplier or the foreign buyer; and to insure Canadian firms against loss of their investments abroad by reason of political actions. Direction of the affairs of the Corporation is vested in a 12-member board, having its head office in Ottawa and district offices in Montreal, Toronto and Vancouver.

Export credits insurance. EDC may insure Canadian exporters against non-payment when they grant credit to foreign buyers under contracts involving the following classes of export transactions: consumer goods sold on short-term credit usual for the particular trade, which normally ranges from documentary sight draft to a maximum of 180 days; capital goods such as heavy machinery sold on medium-term credit which may extend to a maximum of five years; services rendered to a foreign customer, such as design, engineering, construction, and technological and marketing services; treatment or servicing of goods for a foreign customer; photogrammetric and geophysical surveys, etc. EDC may also insure the payment of "invisible" exports such as the sale or licensing to a foreign customer of any right in a patent, trademark or copyright, advertising fees, fees to auditors, consultants, etc. To assist him in financing for exports, a policy-holder may request EDC to assign the proceeds of any losses payable under a policy to a bank or other agent providing financing in respect of export sales. An exporter may assign an individual bill or he may make a blanket assignment of all his foreign accounts receivable.

The main risks covered under an EDC policy are: insolvency of the foreign buyer; failure of the buyer to pay to the exporter within six months after due date the gross invoice value of goods which he has duly accepted; repudiation by the buyer which does not result from a breach of contract by the exporter and where proceedings against the buyer would serve no useful purpose; blockage of funds or transfer difficulties which prevent the Canadian exporter from receiving payment; war or revolution in the buyer's country; cancellation or non-renewal of an export permit and the imposition of restrictions on the export of goods not previously subject to restriction; and any other cause outside the control of both the exporter and the buyer which arises from events occurring outside Canada and continental United States of America, e.g., the cancellation of an import licence or the imposition of import restrictions on goods not previously subject to licence or restriction.

Export finance. EDC also makes long-term loans to foreign purchasers or guarantees private loans to foreign purchasers at internationally competitive interest rates, to finance Canadian exports of capital equipment and services when extended credit terms are not required and when commercial financing is not available. In addition, where international competition so requires, EDC may guarantee local cost financing provided by the private sector, or may finance directly up to a maximum of 20% of the value of the goods and services exported from Canada in respect of a finance project.

While it is not exclusive, the following capital equipment and services, by industry, are eligible for export financing. Power industry: conventional and nuclear power plants, electrification programs and transmission lines, etc.; transportation industry: aircraft, airport projects, flight simulators, navigational equipment, ocean-going vessels, locomotives, rolling stock, subway systems, integrated pipelines, etc.; communications industry: equipment for telecommunications such as telephone systems, microwave facilities, earth satellite stations, etc.; other capital goods industries: equipment for wood, pulp and paper, chemical, mining, construction and metallurgical projects, etc.; under certain conditions long-term loans and guarantees would be available for airport terminals and hotels; and services: services related to appraisal and development (but not feasibility studies) of natural resources and primary and secondary industry projects. EDC may make loans to foreign national development banks for re-lending to importers in their respective countries to enable them to buy Canadian capital goods.

A transaction must be of substantial value (\$1 million or more) for which extended credit terms (beyond five years) are necessary and justifiable; exceptions may be considered in special circumstances, e.g., to enable a Canadian supplier to participate in the field of his specialization in development projects abroad being financed mainly by foreign lenders. The project must be financially and economically sound and the foreign buyer and the country to which the goods are shipped must be creditworthy. The transaction must have a Canadian material/labour content of not less than 80%, it must provide employment and industrial benefits for Canada, as well as give promise of future markets for Canadian exports in the country or geographical area concerned, and all goods and services financed must normally be exported from Canada.

Foreign investment insurance. EDC offers insurance against certain political risks of loss of Canadian investments abroad. Investments may vary from that of the investor acquiring the right to share in the assets of a business carried on in a foreign country to that of the investor lending money to a person in a foreign country for the purpose of establishing a business in that country.

Only new investments made in developing countries qualify for foreign investment insurance but the Export Development Act allows considerable flexibility as to the type. Coverage cannot be extended to existing investments. Before a policy is issued, the Minister of Industry, Trade and Commerce must be assured that the interests of EDC in insured investments will be protected. In addition, the government of the recipient country must signify its approval of the investment by the particular investor.

The program offers facilities covering three broad political risks: inconvertibility, or inability to repatriate earnings or capital; expropriation; and insurrection, revolution or war. The investor can elect to take out a policy covering any, or all, or any combination of the three political risks; coverage is restricted to a maximum of 15 years. Any person, including private companies, government agencies, partnerships and organizations, carrying on business or other activities in Canada, and wishing to insure a new investment, should approach EDC as early as possible in the planning stages of the investment for an opinion as to the eligibility of the proposed investment for foreign investment insurance.

18.2 Tariffs and trade agreements

18.2.1 Canadian tariff structure

Information relating to rates of duty, value for duty and anti-dumping duty is available from the Department of National Revenue, Customs and Excise, which administers the Customs Act, the Customs Tariff and the Anti-dumping Act. Details of the organization and functions of the Tariff Board will be found in Appendix 1.

The Canadian tariff consists, in the main, of three sets of tariff rates — British preferential, most-favoured-nation, and general.

British preferential tariff rates are, with some exceptions, the lowest rates. They are applied to imported commodities from British countries, with the exception of Hong Kong, when conveyed without trans-shipment from a port of any British country enjoying the benefits of the British preferential tariff into a port of Canada. Some Commonwealth countries have trade agreements with Canada that provide for rates of duty, on certain specified goods, lower than the British preferential rates.

Most-favoured-nation rates are usually higher than the British preferential rates and lower than the general tariff rates. They are applied to commodities imported from countries with which Canada has trade agreements. These rates would apply to British countries when they are lower than the British preferential tariff rates. The most important trade agreement concerning the effective rates applied to goods imported from countries entitled to most-favoured-nation rates is the General Agreement on Tariffs and Trade (GATT).

General tariff rates are applied to goods imported from the few countries with which Canada has not made trade agreements.

There are numerous goods which are duty-free under the British preferential tariff, or under both the British preferential and the most-favoured-nation tariffs, or under all tariffs.

Valuation. In general, the Customs Act provides that the value for duty of imported goods shall be the fair market value of like goods as established in the home market of the exporter at the time when and place from which the goods are shipped directly to Canada when sold “(a)

to purchasers located at that place with whom the vendor deals at arm's length and who are at the same or substantially the same trade level as the importer, and (b) in the same or substantially the same quantities for home consumption in the ordinary course of trade under competitive conditions". In cases where like goods are not sold for home consumption but similar goods are sold, the value for duty shall be the cost of production of the goods imported plus an amount for gross profit equal in percentage to that earned on the sale of similar goods in the country of export. The value for duty ordinarily may not be less than the amount for which the goods were sold to the purchaser in Canada, exclusive of all charges thereon after their shipment from the country of export. Internal taxes in the country of export (when not incurred on exported goods), the cost of shipping goods to Canada and similar charges do not normally form part of the value for duty. There are, of course, further provisions for determining value for duty under the Act.

Anti-dumping Act. Canada's Anti-dumping Act provides, in brief, that where goods are dumped, i.e., the export price is less than the normal value, and such dumping has caused, is causing, or is likely to cause material injury to the production of like goods in Canada, or has materially retarded or is materially retarding the establishment of the production in Canada of like goods as determined by the Anti-dumping Tribunal, there shall be levied, collected and paid an anti-dumping duty. This anti-dumping duty is in an amount equal to the margin of dumping of the entered goods.

Drawback. There are provisions in the Customs and Excise Tax Acts for the repayment of a portion of the duty, sales and/or excise taxes paid on imported goods used in the manufacture of products later exported. The purpose of these drawbacks (as these repayments are called) is to assist Canadian manufacturers to compete in foreign markets with foreign producers of similar goods. A second class of drawback, known as "home consumption" drawbacks, is provided for under the Customs Act and the Customs Tariff and applies to imported materials and/or parts used in the production of specified goods to be consumed in Canada.

18.2.2 Tariff and trade arrangements

Canada's tariff arrangements with other countries fall into three main categories: trade agreements with a number of Commonwealth countries; the General Agreement on Tariffs and Trade (GATT); and other arrangements and agreements.

Canada signed the Protocol of Provisional Application of the General Agreement on Tariffs and Trade on October 30, 1947 and brought the General Agreement into force on January 1, 1948. The Agreement provides for scheduled tariff concessions and the exchange of most-favoured-nation treatment among the contracting parties, and lays down rules and regulations to govern the conduct of international trade. As at December 31, 1972 there were 81 members and one provisional member, Tunisia. GATT is applied on de facto basis also to a number of newly independent states pending decision as to their future commercial policies.

Trade relations between Canada and a number of other countries are governed by trade agreements of various kinds, by exchange of most-favoured-nation treatment under Orders in Council, by continuation to newly independent states of the same treatment originally negotiated with the countries previously responsible for their commercial relations and by even less formal arrangements.

Both Britain and Ireland have given notice of their intention to terminate their bilateral trade agreements with Canada on February 1, 1973. As a result of the accession by these countries to the European Economic Community (EEC), the tariff preferences they extend to Canada will be phased out over a transitional period ending in 1977.

18.2.2.1 Tariff and trade arrangements with Commonwealth countries as at December 31, 1972

Australia. Trade agreement in force June 30, 1960. GATT effective January 1, 1948. (Bindings of rates of duty and margins of preference on specified products and exchange of tariff preferences.)

Bangladesh (formerly East Pakistan). Relations covered by Trade Agreement of 1937 with Britain. GATT effective December 16, 1972. (Canada accords British preferential treatment.)

Barbados. Relations are based on Canada - West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective November 30, 1966. (Exchange of preferential tariff treatment.)

Botswana. Relations governed by Trade Agreement of 1937 with Britain. GATT de facto application. (Canada accords British preferential tariff treatment.)

Britain. Trade agreement effective September 1, 1937; modified by exchanges of letters November 16, 1938 and October 30, 1947. GATT effective January 1, 1948. (Various concessions are granted by each country including exchange of preferential tariff treatment. The Agreement, as modified, includes provisions relating to the colonies, dependencies and trusteeships. Britain has given notice of its intention to terminate its bilateral trade agreement with Canada on February 1, 1973. As a result of Britain's accession to the EEC, the tariff preferences it extends to Canada will be phased out over a transitional period ending in 1977.)

Commonwealth Caribbean (Bahamas, Bermuda, British Honduras, Leeward Islands, Windward Islands). Canada - British West Indies Trade Agreement in force April 30, 1927; Canadian notice of termination of November 23, 1938, was replaced by notice of December 27, 1939, which continued the Agreement. Protocol signed July 8, 1966, provides inter alia for continuation of 1925 Agreement. Bermuda, British Honduras, the Leeward Islands and the Windward Islands participate in GATT. (Exchange of preferential tariff treatment.)

Cyprus. Relations governed by Trade Agreement of 1937 with Britain. GATT effective August 16, 1960. (Exchange of British preferential tariff treatment.)

Fiji. Relations governed by Canada - United Kingdom Trade Agreement of 1937. Fiji maintains de facto application of GATT. (Exchange of British preferential tariff treatment.)

Gambia. GATT effective February 18, 1965. (Canada accords British preferential tariff treatment to Gambia. Gambia extends most-favoured-nation treatment to Canada.)

Ghana. GATT effective October 18, 1957. (Canada accords British preferential tariff treatment to Ghana, except on cocoa beans. Ghana extends most-favoured-nation treatment to Canada.)

Guyana. Relations are based on the Canada - West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective July 5, 1966. (Exchange of preferential tariff treatment.)

India. Since 1897 Canada has unilaterally accorded British preferential treatment without contractual obligation. GATT effective July 8, 1948. (Canada accords British preferential tariff treatment to India. India extends most-favoured-nation treatment to Canada.)

Jamaica. Relations are based on Canada - West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective August 6, 1962. (Exchange of preferential tariff treatment.)

Kenya. Relations governed by Trade Agreement of 1937 with Britain. GATT effective December 12, 1963. (Canada accords British preferential tariff treatment to Kenya. Kenya extends most-favoured-nation treatment to Canada.)

Lesotho. Relations governed by Trade Agreement of 1937 with Britain. GATT de facto application. (Canada accords British preferential tariff treatment to Lesotho.)

Malawi. Malawi and Canada observe the terms of 1958 Trade Agreement between Canada and the former Federation of Rhodesia and Nyasaland. GATT effective July 6, 1964. (Exchange of preferential tariff treatment.)

Malaysia. Relations governed by Trade Agreement of 1937 with Britain. GATT effective September 16, 1963. (Exchange of British preferential tariff treatment.)

Maldives. Relations governed by Trade Agreement of 1937 with Britain. GATT de facto application. (Canada accords British preferential tariff treatment.)

Malta. Relations governed by Trade Agreement of 1937 with Britain. GATT effective September 16, 1964. (Exchange of British preferential tariff treatment.)

Mauritius. GATT effective March 12, 1968. (Exchange of British preferential tariff treatment.)

New Zealand. Trade Agreement in force May 24, 1932. GATT effective July 26, 1948. (Bindings of rates of duty on specified products and the exchange of tariff preferences.)

Nigeria. Relations governed by Trade Agreement of 1937 with Britain. GATT effective October 1, 1960. (Canada accords British preferential treatment to Nigeria. Nigeria extends most-favoured-nation treatment to Canada.)

Rhodesia. Canada does not recognize the present government of Rhodesia. (Trade embargo exists between Canada and Rhodesia with certain humanitarian exceptions.)

Sierra Leone. Relations governed by Trade Agreement of 1937 with Britain. GATT effective April 27, 1961. (Canada accords British preferential tariff treatment to Sierra Leone. Sierra Leone extends most-favoured-nation tariff treatment to Canada.)

Singapore. Relations governed by Trade Agreement of 1937 with Britain. GATT de facto application. (Exchange of British preferential tariff treatment.)

Sri Lanka, Republic of (formerly Ceylon). Relations governed by Trade Agreement of 1937 with Britain. GATT effective July 29, 1948. (Exchange of British preferential tariff treatment.)

Swaziland. Relations governed by Trade Agreement of 1937 with Britain. GATT de facto application. (Canada accords British preferential treatment to Swaziland.)

Tanzania. GATT effective for Tanganyika December 9, 1961 and extended to Zanzibar upon formation of United Republic, April 23, 1964. (Canada accords British preferential tariff treatment to Tanzania. Tanzania extends most-favoured-nation treatment to Canada.)

Tonga. Tonga maintains de facto application of GATT. (Exchange of British preferential tariff treatment.)

Trinidad and Tobago. Relations are based on Canada - West Indies Trade Agreement and protocol thereto (see Commonwealth Caribbean). GATT effective August 31, 1962. (Exchange of preferential tariff treatment.)

Uganda. GATT effective October 9, 1962. (Canada accords British preferential tariff treatment to Uganda. Uganda extends most-favoured-nation tariff treatment to Canada.)

Western Samoa. No agreement. (Exchange of British preferential tariff treatment.)

Zambia. GATT de facto application. (Canada accords British preferential tariff treatment to Zambia. Zambia extends most-favoured-nation treatment to Canada.)

18.2.2.2 Tariff and trade arrangements with non-Commonwealth countries, as at December 31, 1972

Algeria. Franco - Canadian Trade Agreement of 1933 applied to Algeria. Algeria maintains de facto application of GATT. (Since the creation of Algeria as an independent state in 1962, Canada has continued to grant most-favoured-nation treatment.)

Arab Republic of Egypt. Exchange of notes in force December 3, 1952. GATT effective May 9, 1970. (Exchange of most-favoured-nation treatment.)

Argentina. Trade Agreement in force November 15, 1941. GATT effective October 11, 1967. (Exchange of most-favoured-nation treatment.)

Austria. GATT effective October 19, 1951. (Exchange of most-favoured-nation treatment.)

Bahrain. Bahrain maintains de facto application of GATT. (Exchange of most-favoured-nation treatment.)

Belgium - Luxembourg. Convention of Commerce with Belgium - Luxembourg Economic Union (including Belgian colonies) entered into effect October 22, 1924. GATT effective January 1, 1948. (Exchange of most-favoured-nation treatment.)

Benelux (Belgium - Netherlands - Luxembourg Customs Union). (See Belgium - Luxembourg and Netherlands.)

Bolivia. Order in Council of July 20, 1935 accepted Article 15 of UK - Bolivia Treaty of Commerce. (Exchange of most-favoured-nation treatment.)

Brazil. Trade Agreement in force April 16, 1943. GATT effective July 31, 1948. (Exchange of most-favoured-nation treatment.)

Bulgaria. Trade Agreement signed October 8, 1963 renewed for further three years from October 8, 1966 and extended on de facto basis. (Exchange of most-favoured-nation treatment and undertaking by Bulgaria to purchase a minimum of 200,000 metric tons of wheat or equivalent in flour during the three-year validity of the Agreement.)

Burma. GATT effective July 29, 1948. (Exchange of most-favoured-nation treatment.)

Burundi. GATT effective November 25, 1965. (Exchange of most-favoured-nation treatment.)

Cameroon. Franco - Canadian Trade Agreement of 1933 applied to Cameroon. GATT effective November 28, 1960. (Exchange of most-favoured-nation treatment.)

Central African Republic. Franco - Canadian Trade Agreement of 1933 applied to Central African Republic. GATT effective August 14, 1960. (Exchange of most-favoured-nation treatment.)

Chad. Franco - Canadian Trade Agreement of 1933 applied to Chad. GATT effective August 11, 1960. (Exchange of most-favoured-nation treatment.)

Chile. Trade Agreement in force October 29, 1943. GATT effective March 16, 1948. (Exchange of most-favoured-nation treatment.)

China. Modus vivendi in force September 28, 1946. (Exchange of most-favoured-nation treatment.)

Colombia. Treaty of Commerce with Britain of February 16, 1866 applies to Canada. Modified by protocol of August 20, 1912 and exchange of notes December 30, 1938. (Exchange of most-favoured-nation treatment.)

Congo (Brazzaville). Franco - Canadian Trade Agreement of 1933 applies to Congo (Brazzaville). GATT effective August 15, 1960. (Exchange of most-favoured-nation treatment.)

Costa Rica. Modus vivendi in force January 26, 1951. (Exchange of most-favoured-nation treatment.)

Cuba. GATT effective January 1, 1948. (Exchange of most-favoured-nation treatment.)

Czechoslovakia. Convention of Commerce in force November 14, 1928. GATT effective May 21, 1948. (Exchange of most-favoured-nation treatment.)

Dahomey. Franco - Canadian Trade Agreement of 1933 applied to Dahomey. GATT effective August 1, 1960. (Exchange of most-favoured-nation treatment.)

Denmark (including Greenland). Treaties of Peace and Commerce with Britain of February 13, 1660 and July 11, 1670 apply to Canada. GATT effective May 28, 1950. (Exchange of most-favoured-nation treatment.)

Dominican Republic. Trade Agreement in force January 22, 1941. GATT effective May 19, 1950. (Exchange of most-favoured-nation treatment, including scheduled concessions.)

Ecuador. Modus vivendi in force December 1, 1950. (Exchange of most-favoured-nation treatment.)

El Salvador. Exchange of notes in force November 17, 1937. (Exchange of most-favoured-nation treatment.)

Equatorial Guinea. Since August 1, 1928, UK - Spain Treaty of Commerce of 1922, Canada - Spain Trade Agreement signed May 25, 1954. GATT de facto application. (Since the creation of Equatorial Guinea as an independent state in 1968, Canada has continued to grant most-favoured-nation treatment.)

Ethiopia. Exchange of notes effective June 3, 1955. (Exchange of most-favoured-nation treatment.)

Finland. Exchange of notes effective November 17, 1948. GATT effective May 25, 1950. (Exchange of most-favoured-nation treatment.)

France and French overseas territories. Trade Agreement in force June 10, 1933. Exchange of notes of September 29, 1934 and additional protocol of February 26, 1935. GATT effective January 1, 1948. (Exchange of most-favoured-nation treatment, including scheduled concessions.)

Gabon. Franco - Canadian Trade Agreement of 1933 applied to Gabon. GATT effective August 17, 1960. (Exchange of most-favoured-nation treatment.)

Germany, Federal Republic of. GATT effective October 1, 1951. (Exchange of most-favoured-nation treatment.)

Greece. Modus vivendi by exchange of notes of July 24-28, 1947. GATT effective March 1, 1951. (Exchange of most-favoured-nation treatment.)

Greenland. (See Denmark.)

Guatemala. Trade Agreement in force January 14, 1939. (Exchange of most-favoured-nation treatment.)

Guinea. Franco - Canadian Trade Agreement of 1933 applied to Guinea. (Since the creation of Guinea as an independent state in 1958, Canada has continued to grant most-favoured-nation treatment.)

Haiti. Trade Agreement in force January 10, 1939. GATT effective January 1, 1950. (Exchange of most-favoured-nation treatment.)

Honduras. Exchange of notes effective July 18, 1956. Ratified in Honduras September 5, 1956. (Exchange of most-favoured-nation treatment.)

Hungary. Trade Agreement January 1, 1972 effective until January 1, 1977. (Exchange of letters outlining Hungarian intention to increase imports from Canada. Provides for annual consultation.)

Iceland. GATT effective April 21, 1968. (Exchange of most-favoured-nation treatment.)

Indonesia. GATT effective March 1, 1948. (Exchange of most-favoured-nation treatment.)

Iran. Iran accorded most-favoured-nation treatment by Order in Council from September 5, 1956. (Canada grants most-favoured-nation tariff rates as long as Iran accords reciprocal treatment.)

Iraq. Special arrangement by Order in Council effective September 15, 1951. (Exchange of most-favoured-nation treatment.)

Ireland. Trade Agreement in force January 2, 1933. Modified by exchange of letters on December 21, 1967. GATT effective December 22, 1967. (Bindings to Canada of rates of duty on specified products, and exchange of preferential treatment. Ireland has given notice of its intention to terminate its bilateral trade agreement with Canada on February 1, 1973. As a result of Ireland's accession to the EEC, the tariff preferences it extends to Canada will be phased out over a transitional period ending in 1977.)

Israel. GATT effective July 5, 1962. (Exchange of most-favoured-nation treatment.)

Italy. Modus vivendi by exchange of notes effective April 28, 1948. GATT effective January 1, 1950. (Exchange of most-favoured-nation treatment.)

Ivory Coast. Franco - Canadian Trade Agreement of 1933 applied to Ivory Coast. GATT effective August 7, 1960. (Exchange of most-favoured-nation treatment.)

Japan. Agreement on Commerce effective June 7, 1954. GATT effective September 10, 1955. (Exchange of most-favoured-nation treatment.)

Khmer Republic (formerly Cambodia). Franco - Canadian Trade Agreement of 1933 applied to Cambodia. Became a de facto member of GATT in 1968. (Since the creation of Cambodia as an independent state in 1955, Canada has continued to grant most-favoured-nation treatment.)

Korea, Republic of. Trade Agreement in force December 20, 1966. GATT effective April 14, 1967. (Exchange of most-favoured-nation treatment.)

Kuwait. GATT effective June 18, 1961. (Exchange of most-favoured-nation treatment.)

Laos. Franco - Canadian Trade Agreement of 1933 applied to Laos. (Since the creation of Laos as an independent state in 1955, Canada has continued to grant most-favoured-nation treatment.)

Lebanon. Special arrangement by Order in Council of November 19, 1946. (Canada grants most-favoured-nation tariff rates as long as Lebanon accords reciprocal treatment.)

Liberia. Special arrangement by Order in Council effective March 1, 1955. (Canada grants most-favoured-nation treatment.)

Liechtenstein. (See Switzerland.)

Luxembourg. (See Belgium - Luxembourg.)

Malagasy Republic. Franco - Canadian Trade Agreement of 1933 applied to Malagasy Republic. GATT effective September 30, 1963. (Exchange of most-favoured-nation treatment.)

Mali. Franco - Canadian Trade Agreement of 1933 applied to Mali. Mali maintains a de facto application of GATT. (Since the creation of Mali as an independent state in 1960, Canada has continued to grant most-favoured-nation treatment.)

Mauritania. Franco - Canadian Trade Agreement of 1933 applied to Mauritania. GATT effective November 28, 1960. (Exchange of most-favoured-nation treatment.)

Mexico. Trade Agreement in force June 5, 1947. (Exchange of most-favoured-nation treatment.)

Morocco. Various agreements relating to former French, Spanish and International Zones of Morocco. (Since the creation of Morocco as an independent state in 1956, Canada has continued to grant most-favoured-nation treatment.)

Netherlands. Convention of Commerce of July 11, 1924 includes Netherlands Antilles and Surinam. GATT effective January 1, 1948. (Exchange of most-favoured-nation treatment.)

Nicaragua. Trade Agreement in force December 19, 1946. GATT effective May 28, 1950. (Exchange of most-favoured-nation treatment.)

Niger. Franco - Canadian Trade Agreement of 1933 applied to Niger. GATT effective August 3, 1960. (Exchange of most-favoured-nation treatment.)

Norway. Convention of Commerce and Navigation with UK of March 18, 1826 applied to Canada. GATT effective July 10, 1948. (Exchange of most-favoured-nation treatment.)

Pakistan. Canada unilaterally accords British preferential treatment without contractual obligation. GATT effective July 30, 1948. (Canada accords British preferential tariff treatment to Pakistan. Pakistan accords most-favoured-nation tariff treatment to Canada.)

Panama. Exchange of notes in force August 12, 1935. (Exchange of most-favoured-nation treatment.)

Paraguay. Exchange of notes in force June 21, 1940. (Exchange of most-favoured-nation treatment.)

Peru. GATT effective October 8, 1951. (Exchange of most-favoured-nation treatment.)

Philippines. Trade Agreement in force August 29, 1972. (Exchange of most-favoured-nation treatment.)

Poland. Convention of Commerce in force August 15, 1936. GATT effective October 18, 1967. (Exchange of most-favoured-nation treatment.)

Portugal, Portuguese adjacent islands and Portuguese overseas provinces. Trade Agreement in force April 29, 1955. GATT effective May 6, 1962. (Exchange of most-favoured-nation treatment.)

Qatar. Qatar maintains de facto application of GATT. (Exchange of most-favoured-nation treatment.)

Romania. Trade Agreement effective for three years from March 22, 1971. GATT effective November 14, 1971. (Exchange of most-favoured-nation treatment and Romania endeavours to provide improved access for Canadian exports. Provides for annual consultation.)

Rwanda. GATT effective January 1, 1966. (Canada grants most-favoured-nation treatment.)

Senegal. Franco - Canadian Trade Agreement of 1933 applied to Senegal. GATT effective June 20, 1960. (Exchange of most-favoured-nation treatment.)

South Africa. Trade Agreement in force October 13, 1932. Exchange of notes August 2-31, 1935, effective retroactively from July 1, 1935. GATT effective June 14, 1948. (Exchange of British preferential rates on scheduled items. Exchange of most-favoured-nation treatment.)

Spain and Spanish possessions. Since August 1, 1928. Canada has adhered to UK - Spain Treaty of Commerce of October 31, 1922. Trade Agreement signed May 26, 1954. GATT effective August 29, 1963. (Exchange of most-favoured-nation treatment.)

Sweden. UK - Sweden Convention of Commerce and Navigation of March 18, 1826 applies to Canada. GATT effective May 1, 1950. (Exchange of most-favoured-nation treatment.)

Switzerland. UK - Switzerland Treaty of Friendship, Commerce and Reciprocal Establishment of September 6, 1855 applies to Canada. By exchange of notes Liechtenstein included under terms of this Agreement, effective July 11, 1947. GATT effective August 1, 1966. (Exchange of most-favoured-nation treatment.)

Syrian Arab Republic. Special Arrangement by Order in Council of November 19, 1946. (Canada grants most-favoured-nation treatment tariff rates as long as Syria accords reciprocal treatment.)

Thailand. Modus vivendi effective April 22, 1969. (Exchange of most-favoured-nation treatment.)

Togo. Franco - Canadian Trade Agreement of 1933 applied to Togo. GATT effective March 20, 1964. (Exchange of most-favoured-nation treatment.)

Tunisia. Trade Agreement in force August 8, 1972. Tunisia acceded to GATT provisionally in 1959. (Exchange of most-favoured-nation treatment.)

Turkey. Exchange of notes in effect March 15, 1948. GATT effective October 17, 1951. (Exchange of most-favoured-nation treatment.)

Union of Soviet Socialist Republics. Trade Agreement effective from April 1972 to April 1976. (Exchange of most-favoured-nation treatment and annual consultation.)

United States of America. Trade Agreement of November 17, 1938 suspended as long as both countries continue to be contracting parties to GATT. GATT effective January 1, 1948. (Exchange of most-favoured-nation treatment.)

Upper Volta. Franco - Canadian Trade Agreement of 1933 applied to Upper Volta. GATT effective August 5, 1960. (Exchange of most-favoured-nation treatment.)

Uruguay. Trade Agreement in force May 15, 1940. Additional protocol signed October 19, 1953. GATT effective December 16, 1953. (Exchange of most-favoured-nation treatment.)

Venezuela. Modus vivendi in force October 11, 1950. (Exchange of most-favoured-nation treatment. Made for one year subject to annual renewal.)

Viet-Nam. Franco - Canadian Trade Agreement of 1933 applied to Viet-Nam. (Since 1955, Canada has continued to accord most-favoured-nation rates.)

Yemen, People's Republic of. Yemen maintains de facto application of GATT. (Exchange of most-favoured-nation treatment.)

Yugoslavia. Trade Agreements Act of June 11, 1928 accepted Article 30 of UK - Serb - Croat - Slovene Treaty of Commerce and Navigation in force August 9, 1928. GATT effective August 25, 1966. (Exchange of most-favoured-nation treatment.)

Zaire (formerly Congo, Kinshasa). Belgo - Canadian Convention of Commerce of 1924 applied to Congo (Kinshasa). GATT effective September 11, 1971. (Exchange of most-favoured-nation treatment.)

18.3 International trade statistics

Canadian foreign trade statistics are compiled from information recorded on customs documents received by Statistics Canada from customs ports, supplemented with energy data obtained through other channels. Trade figures reflect the physical movements of goods across Canada's national and customs boundaries but do not always represent the financial transactions for changes in ownership of these goods.

Coverage. Total Canadian exports are the sum of domestic exports and re-exports. Domestic exports include shipments abroad of goods wholly produced in Canada together with exports of previously imported goods which have been changed in form by further processing in Canada. Re-exports or exports of foreign produce include only goods previously included in import statistics which are exported from Canada in the same form as when imported. Minor operations such as cleaning, sorting and repacking are not considered as changing the condition of imported goods. Following the introduction in January 1964 of the "General trade" system of compilation, re-exports have also included outward movements of goods previously imported but stored in customs warehouses.

Imports, as from January 1964, include all goods cleared by customs immediately on arrival in Canada together with goods that are entered into customs warehouses. For earlier years, imports under the "Special trade" system of presentation included goods cleared immediately on arrival plus goods cleared for consumption out of customs warehouses. This meant that those goods which crossed the national boundary into and out of customs warehouses without crossing the customs boundary were excluded.

Since January 1960 certain commodities have been excluded from both export and import trade statistics but have been published monthly under "Special transactions - non-trade". This category includes commodity movements which either have no international financial implications or are better considered as non-merchandise transactions in the statistics of Canada's balance of international payments. These are: unrefined gold, gold products where the gold content is 80% or more of the total value, and gold coin, except collections; settlers'

effects; private donations and gifts; tourist purchases; goods shipped back and forth across the national boundary by the diplomatic and military personnel of Canada and of foreign countries posted abroad and in Canada, respectively; temporary movements for exhibition or competition, including films for processing; bunker supplies and stores sold to foreign vessels or aircraft in Canada or purchased by Canadian carriers abroad; military grants to NATO member countries; ships of British construction and registry imported for use in Canada, and ships purchased for use as international carriers but not used to carry goods between points in Canada; and generally, all temporary exports and imports and goods merely moving in transit through Canadian territory.

The series "Gold production available for export", which is an item of non-merchandise transactions in the current account of the Canadian balance of international payments, is covered in Chapter 21.

Valuation. Export documents define the valuation to be used as f.o.b. (free on board) place of lading, i.e., point of production for the majority of commodities, Vancouver and St. Lawrence ports for grain and oil seeds and the latter for iron ore. The value of goods imported is usually the value as determined for customs purposes based on the fair market value or the selling price, whichever is higher. For entries exceeding \$50,000 in value, however, the selling price is, with certain exceptions, compiled. In the majority of cases, import documents define the valuation to be used as f.o.b. points of shipment in the country of export; however, where importers report c.i.f. (cost, insurance, freight), care is taken to compile f.o.b. values.

Classification. Beginning with statistics for January 1961 and January 1964, detailed commodity statistics for exports and imports, respectively, have been compiled according to revised classifications, on the basis of the Standard Commodity Classification developed by Statistics Canada as a tool for integrating statistical series derived from different sources. The revised classifications place commodities in sections mainly according to stage of processing and purpose, as follows: Live animals; Foods, feed, beverages and tobacco; Crude materials, inedible; Fabricated materials, inedible; End products, inedible; and Special transactions – trade. Previously, commodities were classified primarily according to the material of which they were chiefly composed.

Trade is classified to countries on the basis of consignment. Exports are considered to be consigned to the country to which they are shipped when they leave Canada, i.e., the farthest known destination. Imports are classified to the country from which goods are shipped to Canada, except for goods produced in Central or South America but consigned to Canada from the United States; these goods are credited to the country of origin.

Statistics are compiled and presented for some 150 individual countries, arranged primarily according to geographical location, but also grouped because of common political heritage and tariff arrangements, such as Commonwealth and preferential countries, and of economic links, such as the European Economic Community.

Discrepancies in trade statistics between Canada and other countries. Canada's statistics of exports are rarely in exact agreement with the import statistics of its customers and parallel differences occur with Canadian imports. Major factors contributing to these discrepancies include: differences in the system of valuation used by Canada and those of other countries, with respect to the treatment of transportation charges, fair market and transaction values; differences in the statistical treatment of special categories of trade, such as military supplies, government-financed gifts of commodities, postal and express shipments, tourist purchases, bunkers and warehouse trade; differing definitions of territorial areas; differing systems of crediting trade by countries, notably the consignment system used by Canada and the actual origin or ultimate destination system in use in some other countries; and differences in the time at which trade is recorded in the statistics of partner countries caused by the time required for goods to move from one country to another.

Table 18.1 summarizes total international trade of Canada for selected years 1956-71 and shows the balance of trade for each year. In 1956, Canada's imports exceeded exports by \$713.2 million; since then, a favourable balance of trade has been maintained although with some fluctuation from year to year. The excess of exports over imports reached a high of \$2,868.2 million in 1970, dropping to \$2,137.0 million in 1971.

18.3.1 Trade by geographic region

Table 18.2 shows the importance to the Canadian economy of trade with the US. Exports to the US in 1961 constituted 54.0% of the total, to the UK 15.8%, to other Commonwealth and preferential countries 5.7%, and to all other countries 24.5%. By 1971, exports to the US had increased to 67.3% of the total while those to the UK had been halved to 7.8%; exports to other Commonwealth and preferential countries and all other countries declined to 3.9% and 21.0%, respectively. The proportion of Canadian imports from the US increased from 67.0% to 70.1% over the ten-year period and decreased from 10.7% to 5.4% for the UK and from 5.1% to 4.0% for Commonwealth and other preferential countries; imports from all other countries showed an increase from 17.2% to 20.5% of the total.

Table 18.3, giving Canadian exports and imports by the 30 leading countries in 1971, shows that over the period 1969-71 the United States, United Kingdom, Japan and Federal Republic of Germany were Canada's main trading partners. In 1971 exports to the

Netherlands maintained fifth place, while those to Italy rose to sixth place from eighth and to the People's Republic of China to seventh place from eleventh. Imports from Venezuela continued in fifth place and those from France, sixth; with only slight changes in order, Australia, Sweden and Switzerland maintained eighth, ninth and tenth places over the period.

Values of domestic exports and imports, by geographic region and country, for 1968-71, are shown in Table 18.4, and of dutiable and free imports for 1969-71 in Table 18.5.

18.3.2 Trade by commodity

Detailed information on the composition of Canada's exports for 1970 and 1971 is given in Table 18.6. In both years, exports in the Fabricated materials, inedible, and the End products, inedible, sections each made up roughly one third of the total. Approximately 19% of the former section was newsprint paper in both 1970 and 1971, 78.6% of which went to the US in 1970 and 81.2% in 1971, followed by wood pulp and similar pulp which made up more than 13%.

In the End products, inedible, section, passenger automobiles and chassis made up 30.5% in 1970, increasing to 33.2% in 1971, almost all of which went to the US. Trucks, truck tractors and chassis, motor vehicle engines and parts, and motor vehicle parts combined accounted for an almost equal amount. Crude materials, inedible, made up the third most valuable export, accounting for 18.7% in each year. Food, feed, beverages and tobacco at \$1,800.3 million in 1970 and \$2,035.3 million in 1971, comprised 11.0% and 11.8%, respectively, of total exports, 33.6% of which went to the US in 1970 and 29.5% in 1971.

Table 18.7 gives details of Canada's imports for 1970 and 1971. As with exports, imports of Fabricated materials, inedible, and End products, inedible, made up the larger part in both years. Crude materials, inedible, accounted for about 8.5% and Food, feed, beverages and tobacco for some 7.5%.

18.3.3 Trade by section and stage of fabrication

Tables 18.8 and 18.9 present historical series of Canada's external trade for selected years 1956-71 by section and stage of fabrication. Estimates for the years prior to 1958 are subject to some limitations because of the introduction of the revised commodity trade classifications in the early 1960s.

Methodology. To allocate exports and imports into the statistical framework based on stage of fabrication, i.e., crude materials, fabricated materials and end products, requires a secondary classification of the commodities in certain sections of the standard commodity classification (SCC). Live animals (Section I), being a natural product, are considered as crude materials. Section II (Food, feed, beverages and tobacco) is distributed as follows: crude materials include natural products not processed beyond cleaning or preparation for shipment, such as fresh fruits and vegetables, raw sugar, etc.; fabricated materials include commercial feed stocks and commodities which are further processed rather than used for direct consumption; and end products comprise prepared pet feeds and commodities which require no further processing but are used directly for consumption, such as cheese, canned foods, whisky, cigars and cigarettes. Sections III, IV and V are as defined in the SCC. Thus, Section V (Inedible end products) consists of articles rather than materials, i.e., finished commodities which have attained their final degree of processing together with specific parts and accessories of machinery which are classified with the machinery. Section VI (Special transactions — trade), which contains comparatively few classes, has been distributed on the basis of special studies.

Exports. Canada's exports followed a steady upward trend over the 15-year period 1956-71. The acceleration in the growth of domestic exports in the period 1961-66 was followed by a somewhat slower growth during the next five-year period. Exports of manufactured goods recorded much higher rates of increase than those of crude materials and end products and increased more rapidly to the US than to all other countries. Domestic exports by section and stage of fabrication, 1956-71 are presented in Table 18.8; average annual rates for major categories are given in Table 18.10.

Imports. At 7.2%, imports rose slightly less than exports over the same period, 1956-71, with interruptions in growth in the second half of the 1950s and in 1970. The sharp acceleration in the growth rate of imports in the years 1961-66 was followed by a moderating trend in the following period 1966-71. Values of domestic imports are shown in Table 18.9 and percentage growth rates in Table 18.10.

Unlike export trade, the growth of import trade with the United States has been slower than with all countries. In 1971, exports and imports reached new highs of \$17,743.6 million and \$15,606.6 million, respectively. Moderately rising demand from the United States and weaker overseas markets, along with a sharp rise in Canadian import demand, reduced the trade balance from \$2,868.2 million to \$2,137.0 million.

18.4 International travel

Travel between Canada and other countries grew at a slower rate in 1971. Both receipts and payments from international travel increased by less than 5%, compared with gains of close to 15% a year earlier, and receipts rose at a slightly higher rate than payments, reducing the deficit on travel account. The growth in travel in 1971 was dampened to a greater degree in North America than in Europe, where rapid growth rates were experienced for the second consecutive year. Travel earnings for both Canada and the United States advanced by less than 7%, while European countries registered substantial gains of about 20%. In Japan, travel receipts declined following the World Exposition in Osaka by a rate identical to that experienced in Canada after Expo 67.

Since 1961, non-resident travellers visiting Canada have increased by 10 million, approaching a total of 39 million in 1971. Non-residents staying one or more nights, who account for the greater proportion of expenditures, numbered 15 million in 1971. Canadian travel receipts, in turn, have increased almost threefold since 1961, reaching \$1,283 million. Receipts in 1971 accounted for just under 6% of the total current receipts in the balance of payments, virtually unchanged since 1961. Compared with other major countries, Canada ranked sixth in travel earnings from non-resident visitors in 1971. Those countries ranking ahead of Canada were, in order, the United States, Spain, Italy, the Federal Republic of Germany and France. Austria and the United Kingdom ranked closely behind Canada.

The number of Canadian residents returning from visits abroad over the past ten years has increased by 20% to a total of 35 million in 1971. The number of long-term travellers has doubled over the same period to a total of 11 million. Canadian travel payments have more than doubled the 1961 figure and reached a record high of \$1,494 million. Internationally, Canada ranked third in total resident travel expenditures abroad, behind the United States and the Federal Republic of Germany but ahead of France and the United Kingdom.

The share of disposable income on foreign travel at about 2.5% has not significantly changed since 1961. Per capita expenditures on Canadian travel abroad, in terms of current dollars, have increased steadily from \$35 in 1961 to \$69 in 1971.

Travel between Canada and the United States. The growth in travel receipts from United States residents levelled off in 1971 with a gain of only 4% compared with increases of 13% and 8% in the two previous years. The slower rate of growth may be a reflection of the uncertain economic climate prevailing in 1971 and of the appreciation of the Canadian dollar, which moved close to parity in terms of the United States dollar.

The number of United States travellers visiting Canada in 1971 totalled 38.4 million, 3.5% more than in the previous year. Travellers entering Canada and leaving the same day numbered 24.1 million while the remaining 14.3 million stayed one or more nights in Canada.

The private car remained the dominant form of transportation (86%) for United States residents visiting Canada; about 12.8 million automobiles with 33.2 million visitors were reported entering Canada during 1971. The rate of growth in air travel stabilized in 1971 following substantial increases in 1970 and 1969, and bus travel grew at the rate of 14%, while rail travel was affected by the closure of services through various ports across the country.

The travel characteristics of United States visitors to Canada remained basically similar to those in 1970. The majority of travellers originated from the Middle Atlantic and East - North - Central regions, and the main destinations reported by respondents to survey questionnaires were Ontario and Quebec. The prime reasons for coming to Canada were recreation and visits to friends or relatives, and the main type of lodging used while in Canada remained hotels, motels and resorts; the average length of stay of long-term travellers was about five nights.

Canadian visits to the United States in 1971 numbered 34.3 million, down from 35.7 million in 1970, as the result of 6.1% fewer short-term visits to the United States. Canadian residents staying one or more nights in the United States increased 2% from 1970.

The automobile remained the preferred mode of transportation in travel to the United States, 86% of the total re-entries and 80% of those staying one or more nights in 1971. Travel

international travel account

by air, although only 4% of the total and 12% of the long-term traffic, has increased at a faster pace in recent years.

An examination of travel payments (including passenger fares paid to United States carriers) in relation to the population of Canada shows that Canadians spent \$40 per capita on travel in the United States. The ratio fluctuated between a high of \$47 per resident of Ontario to a low of \$17 per resident of Saskatchewan.

As in 1970, Canadian travellers staying one or more nights in the United States during 1971 remained an average of eight days and spent an average of \$11 per day. Half of these travellers visited the New England and Middle Atlantic regions; almost 60% reported holidays as the main reason for their visit, and 50% used resorts, hotels or motels.

Summary statistics are given in Tables 18.11-18.13.

Travel between Canada and overseas countries. Overseas visitors to Canada in 1971 numbered 543,000, a 1.4% increase over the previous year. Estimated receipts in 1971 totalled \$154 million, including \$53 million in transportation fares paid to Canadian carriers, compared with \$152 million in total spending in 1970 (Table 18.14).

Total receipts in 1971 equalled the record spending of overseas visitors during Canada's centennial year. An analysis of previous years' data reveals that since 1950 the growth in receipts has been linear and has doubled approximately every seven years.

Overseas visitors from the United Kingdom comprised 27.7% of the total compared with 29.5% in 1970. Visitors from OECD countries in Europe accounted for 36.5% of total entries, unchanged from the previous year; 41.9% of this group were residents of the Federal Republic of Germany or France.

Estimated expenditures by area of residence indicate that visitors from the United Kingdom spent \$42 million in 1971 compared to \$44 million the previous year. Visitors from the other OECD countries in Europe spent \$54 million in 1971, a slight increase over 1970.

Overseas visitors remained in Canada an estimated 9.8 million nights, a 7.4% decrease from 1970, the average stay decreasing from 19.7 nights to 18.0. Average expenditure per trip decreased from \$192 to \$186, a reflection in part of the decrease in length of stay. Of total entries from overseas 80.8% were classified as tourists and visitors, and 45.8% indicated Ontario as their province of destination, 28.5% named Quebec and 14.7% British Columbia.

The growth in Canadian resident travel to overseas countries continued in 1971 as lower fares continue to lure more Canadians abroad. In 1971, 1,197,200 Canadian residents returned from visits to overseas countries, an 8.9% increase over the previous year. Total expenditure of Canadian residents was \$550 million, including international fare payments to foreign carriers, compared to \$524 million spent in 1970.

Questionnaire response shows that 20% of total Canadian resident travellers re-entering from abroad gave the United Kingdom only as their main destination. Residents of Canada returning from trips to other OECD countries in Europe only accounted for 21.0% of total re-entries, and Bermuda and the Caribbean accounted for 18.0%.

Total person nights in 1971 numbered 30.0 million, a 2.8% increase over the previous year. The average stay decreased from 26.6 nights in 1970 to 25.1 in 1971, and the total of nights stayed has approximately doubled since 1968. The average expenditure in 1971 was \$341 compared with \$352 a year earlier, and does not include international transportation fares, which have been excluded for the calculations; the average expenditure has changed only marginally since 1968, when it was \$350.

The majority of Canadian residents returning from overseas countries indicated holiday and recreation as the main purpose of their trip. In 1971 this group accounted for 61.4% of total re-entries from abroad compared with 57.4% in 1970, and those residents visiting friends and relatives accounted for 26.1% of total re-entries compared with 29.7% in the previous year.

Chapter 19

Banking, finance and insurance

19.1 Banking

19.1.1 The Bank of Canada

Canada's central bank, the Bank of Canada, began operations on March 11, 1935, under the terms of the Bank of Canada Act, 1934, which charged it with the responsibility for regulating "credit and currency in the best interests of the economic life of the nation", and conferred on it specific powers for discharging this responsibility. Through the exercise of these powers, the Bank broadly determines the combined total of the most common forms of Canadian money held by the community – chartered bank deposits and currency. Revisions to the Bank of Canada Act, 1934, were made in 1936, 1938, 1954 and 1967, and are included in RSC 1970, c.B-2.

The provisions of the Bank of Canada Act enable the central bank to determine the total amount of cash reserves available to the chartered banks as a group and in that way to control the rate of expansion of the total assets and deposit liabilities of the banking system as a whole. The Bank Act, which regulates the operation of the chartered banks, requires that each chartered bank maintain a stipulated minimum average amount of cash reserves, calculated as a percentage of its Canadian dollar deposit liabilities, in the form of deposits at the Bank of Canada and holdings of Bank of Canada notes. The minimum cash reserve requirement, which came into effect under the legislation beginning February 1, 1968, is 12% of demand deposits and 4% of other deposits. The ability of the chartered banks as a group to expand their total assets and deposit liabilities is therefore limited by the total amount of cash reserves available. An increase in cash reserves will encourage the banks as a group to expand their total assets (which consist chiefly of loans and marketable securities) with a concomitant increase in their deposit liabilities; a decrease in cash reserves will bring about a decline in their total assets and deposit liabilities as they seek to restore their cash reserve ratios.

The chief method by which the Bank of Canada alters the level of cash reserves of the chartered banks over time, and through them the total of chartered bank deposits, is by purchases and sales of government securities. Payment by the central bank for the securities it purchases in the market adds to the cash reserves of the chartered banks as a group and puts them in a position to expand their assets and deposit liabilities. Conversely, payment to the central bank for securities it sells causes a reduction in the cash reserves of the chartered banks and requires them to reduce their holdings of assets and deposit liabilities.

The influence the Bank of Canada exerts on credit conditions (i.e., on interest cost and other terms of borrowing in financial markets) stems from its ability to limit the growth of bank credit and of the community's holdings of bank deposits and currency. The growth rate of the banking system is one of the factors exerting an important influence on the level of interest rates and other terms of access to credit prevailing in financial markets generally. Current credit conditions (and expectations about future trends in such conditions) in turn have an influence on business and household decisions to spend or to save. Many other factors have an important effect on spending decisions and the behaviour of the economy is subject to such influences as economic and financial developments abroad; the investment, price and wage policies of business firms in Canada; and the character of public policies at all levels of government with regard to expenditure and taxation. In using the powers at its disposal, the Bank attempts to bring about credit conditions appropriate to both domestic and external conditions. Its operations must be based, not on any simple mechanical formula, but rather on continuous observation and appraisal of the constantly changing prospects for the economy as reflected in the complex pattern of economic and financial developments.

In a technical sense, the powers that the central bank possesses allow it to exert a strong influence over economic activity but, in practice, the range through which credit conditions can be permitted to vary is necessarily limited. Changes in credit conditions in Canada affect the position of some groups in the economy much more than that of others, and this uneven impact is bound to inhibit the central bank's operations. Furthermore, interest rates in Canada cannot change greatly in relation to those abroad without producing large capital movements

which might complicate Canada's international payments position. These considerations suggest that monetary policy must be used in appropriate combination with other public economic policies in order to help achieve national economic goals.

Although the Bank of Canada has the power to determine the rate of growth of the combined total of currency and chartered bank deposits, it has no means of determining how much of this total is held in the form of currency and how much in the form of chartered bank deposits. This depends entirely on the preferences of the public, since bank deposits can be converted freely into notes and coin and back again.

Although the cash reserve system in Canada — which is similar to that in a number of other countries — enables the central bank to determine within broad limits the total amount of chartered bank assets and deposit liabilities, the Bank of Canada leaves the allocation of bank and other forms of credit to the private sector of the economy. Each chartered bank is free to attempt to gain as large a share as possible of the total cash reserves available by competing for deposits and to decide what proportion of its funds to invest in particular kinds of securities and in loans to particular types of borrowers. The influence of the central bank — based in essence on its power to expand or contract chartered bank cash reserves through its market purchases or sales of securities — is both indirect and impersonal and is brought to bear on financial conditions generally through the chartered banks and the numerous interconnected channels of the capital market.

The Bank may buy or sell securities issued or guaranteed by Canada or any province, short-term securities issued by Britain, treasury bills or other obligations of the United States and certain types of short-term commercial paper. The Industrial Development Bank Act authorizes the Bank to purchase securities issued by that institution. The Bank may buy or sell gold, silver, nickel and bronze coin, or any other coin, and gold and silver bullion as well as foreign exchange and may accept non-interest-bearing deposits from the Government of Canada, the government of any province, any chartered bank and any bank regulated by the Quebec Savings Bank Act. The Bank may open accounts in other central banks; accept deposits from other central banks, the International Monetary Fund, the International Bank for Reconstruction and Development, and any other official international financial organization; and pay interest on such deposits. The Bank does not accept deposits from individuals nor does it compete with the chartered banks in the commercial banking field. It acts as the fiscal agent for the Government of Canada in the payment of interest and principal and generally in respect of the management of the public debt of Canada. The sole right to issue paper money for circulation in Canada is vested in the Bank.

The Bank of Canada may require the chartered banks to maintain, in addition to the legal minimum cash reserve requirement mentioned above, a secondary reserve which the Bank may vary within certain limits. The secondary reserve, which consists of cash reserves in excess of the minimum requirement, treasury bills and day-to-day loans to investment dealers, cannot be more than 6% of total deposits when first introduced nor can it exceed 12%; effective January 1972, the required level was 8%. In the event the Bank wishes to introduce or increase the secondary reserve requirement, one month's notice to the chartered banks is required; the amount of any increase in the requirement cannot exceed 1% per month. In the case of a lowering of the secondary reserve requirement, however, the percentage change in any one month is not restricted.

The Bank of Canada may make loans or advances for periods not exceeding six months to chartered banks, or to banks to which the Quebec Savings Bank Act applies, on the pledge of certain classes of securities. Loans or advances may be made under certain conditions and for limited periods to the Government of Canada or of any province. The Bank of Canada is required to make public at all times the minimum rate at which it is prepared to make loans or advances; this rate is known as the bank rate. From November 1, 1956 until June 24, 1962, the bank rate was established weekly at a fixed margin of $\frac{1}{4}$ of 1% above the latest weekly average tender rate for 91-day treasury bills. Bank rates since June 24, 1962, have been fixed from time to time and are given in Table 19.1. The rate as at December 31, 1972 was 4.75% per annum.

From June 24, 1962 to November 12, 1970, the money-market rate — the rate at which the Bank of Canada is prepared to enter into purchase and resale agreements with money-market dealers — was either $\frac{1}{4}$ of 1% above the average rate on 91-day treasury bills at the preceding weekly tender or the bank rate, whichever was lower; since November 12, 1970, the minimum rate is the bank rate less $\frac{3}{4}$ of 1%.

Assets and liabilities of the Bank of Canada at December 31, 1970-72 are shown in Table 19.2. The Bank is not required to maintain gold or foreign exchange reserves against its liabilities.

Prior to the 1967 amendment of the Bank of Canada Act, there existed some uncertainty about the exact relationship between the central bank and the government. The changes in the Bank of Canada Act in 1967 were designed to clarify this matter. They provide for regular consultation between the Governor of the Bank and the Minister of Finance as well as for a formal procedure whereby, in the event of a disagreement between the government and the Bank which cannot be resolved, the government may, after further consultation has taken place, issue a directive to the Bank as to the monetary policy that it is to follow. Any such directive must be in writing, it must be in specific terms, and it must be applicable for a specified period. It must be published immediately in the *Canada Gazette* and tabled in Parliament. The amendment makes it clear that the government must take the ultimate responsibility for monetary policy and it provides a mechanism for that purpose but the central bank is in no way relieved of its responsibility for monetary policy and its execution.

The Bank is under the management of a Board of Directors composed of a Governor, a Deputy Governor and twelve directors. The Governor and Deputy Governor are appointed for terms of seven years each by the directors, with the approval of the Governor in Council. The directors are appointed by the Minister of Finance, with the approval of the Governor in Council, for terms of three years each. The Deputy Minister of Finance is a member of the Board but does not have the right to vote. There is an Executive Committee of the Board composed of the Governor, the Deputy Governor, two directors and the Deputy Minister of Finance (who is without a vote); this Committee has the same powers as the Board except that its decisions must be submitted to the Board at its next meeting. In addition to the Deputy Governor who is a member of the Board, there may be one or more Deputy Governors appointed by the Board of Directors to perform such duties as are assigned by the Board.

The head office of the Bank is in Ottawa. It has agencies in Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Regina, Calgary and Vancouver and is represented in St. John's and Charlottetown.

The Industrial Development Bank, a federal Crown corporation and a subsidiary of the Bank of Canada, was established by Act of Parliament in 1944 to provide capital assistance to develop new businesses and to finance the expansion programs of existing small and medium-size businesses which are unable to obtain financing elsewhere in Canada under reasonable conditions and terms.

The President of the Industrial Development Bank (IDB) is the Governor of the Bank of Canada and the directors are the directors of the Bank of Canada and the Deputy Minister of Industry, Trade and Commerce. The authorized capital of the IDB is \$75 million and it may also raise funds by the issue of bonds and debentures provided that its total direct liabilities and contingent liabilities in the form of guarantees and underwriting agreements do not exceed ten times the aggregate of its paid-up capital and reserve fund. The total amount of commitments of the IDB in the form of loans, guarantees, etc., in excess of \$200,000 each, may not exceed \$200 million. Assets and liabilities of the IDB are given in Table 19.3.

The purpose of the IDB is to promote the economic welfare of Canada by ensuring the availability of credit to industrial enterprises which may reasonably be expected to prove successful, by supplementing the activities of other lenders and by providing financial assistance to industry with particular emphasis in meeting the needs of small enterprises. The IDB may, among other things, lend money, guarantee loans to other lenders and purchase shares of a corporation with a view to the resale of the shares. The IDB can lend to virtually any industry, trade or other business undertaking of any kind and meet any sort of financial need.

The IDB Act stipulates that the amount invested or to be invested in the industrial enterprise by persons other than the IDB should be such as to afford it reasonable protection. A loan proposal is then assessed on the grounds of its business viability and creditworthiness.

During the past year the IDB has launched an advisory services function to provide small businesses with various services of a non-monetary nature; they are mostly informational including education material on business management in the form of a series of booklets. Seminars on business management are being conducted by the IDB in smaller centres across Canada where this type of service is not now available.

The IDB has 46 branches across Canada located in the following cities: St. John's, Halifax, Sydney, Saint John, Moncton, Charlottetown, Rimouski, Chicoutimi, Quebec, Trois-Rivières, Sherbrooke, Montreal, Longueuil, Rouyn - Noranda, Ottawa, Kingston, Toronto, Hamilton, St. Catharines, Kitchener - Waterloo, London, Windsor, Sudbury, Sault Ste. Marie, Thunder Bay, Kenora, Winnipeg, Brandon, Regina, Saskatoon, Lethbridge, Calgary, Edmonton, Grande Prairie, Cranbrook, Kelowna, Prince George, Chilliwack, New Westminster, Vancouver, North Vancouver, Victoria and Campbell River.

19.1.2 Currency

Note circulation. The development by which bank notes became the chief circulating medium in Canada prior to 1935 is described in the *1938 Canada Year Book*, pp. 900-905. Those features of the development which then became permanent are outlined in the *1941 Canada Year Book*, pp. 809-810.

When the Bank of Canada commenced operations in 1935 it assumed liability for Dominion notes outstanding. These were replaced in public circulation and partly replaced in cash reserves by the Bank's legal tender notes in denominations of \$1, \$2, \$5, \$10, \$20, \$50 and \$100. Deposits of chartered banks at the Bank of Canada completed the replacement of the old Dominion notes of \$1,000 to \$50,000 denomination that had previously been used as cash reserves. The chartered banks were required under the Bank Act of 1934 to reduce gradually the issue of their own bank notes during the years 1935-45 to an amount not in excess of 25% of their paid-up capital on March 11, 1935. Bank of Canada notes thus replaced chartered bank notes as the issue of the latter was reduced. Further restrictions introduced by the 1944 revision of the Bank Act cancelled the right of chartered banks to issue or re-issue notes after January 1, 1945, and in January 1950 the chartered banks' liability for such of their notes issued for circulation in Canada as then remained outstanding was transferred to the Bank of Canada in return for payment of a like sum to the Bank of Canada.

Bank of Canada note liabilities for the years 1970-72 are given in Table 19.4. Note circulation in public hands as at December 31, 1972 amounted to \$4,055.7 million, compared to \$3,505.8 million in 1971 and \$3,106.2 million in 1970.

Dollar currency and bank deposits. Bank of Canada statistics concerning currency and chartered bank deposits are given in Table 19.5.

19.1.3 Coinage

Under the Currency and Exchange Act (RSC 1970, c.C-39), gold coins may be issued in the denomination of \$20 (nine tenths fine or millesimal fineness 900); subsidiary coins in denominations of \$1, 50 cents, 25 cents, ten cents (five tenths fine or millesimal fineness 500, or pure nickel); pure nickel five-cent coins; and bronze (copper, tin and zinc) one-cent coins. Provision is made for the temporary alteration of composition in the event of a shortage of prescribed metals. A tender of payment of money in coins is a legal tender in the case of gold coins issued under the authority of Section 4 of the Currency and Exchange Act for the payment of any amount; in the case of silver coins for the payment of an amount up to \$10; nickel coins for payment up to \$5; and bronze coins up to 25 cents.

Table 19.6 gives figures for the value of Canadian coins in circulation. Receipts of gold bullion at the Royal Canadian Mint and bullion and coinage issued are given in Table 19.7.

The Ottawa Mint, established as a branch of the Royal Mint under the (Imperial) Coinage Act of 1870, was opened on January 2, 1908. On December 1, 1931, it became the Royal Canadian Mint and operated as a branch of the Department of Finance. The Mint was established as a Crown (agency) corporation in 1969 to allow for a more industrial type of organization and for flexibility in producing coins of Canada and other countries; buying, selling, melting, assaying and refining gold and precious metals; and producing medals, plaques and other devices.

Financial and budgeting arrangements are similar to those of other Crown companies carrying on industrial or commercial operations. Loans are made from the Consolidated Revenue Fund for operating and capital expenses, with the total outstanding at any time limited to \$35 million. Provision is made for loans for temporary purposes and a reserve is established against losses. Operations are conducted with the aim of making a small profit.

On December 16, 1971, a decision was made by the Cabinet to locate a new plant for the production of coin for general circulation in the Winnipeg area of Manitoba. Work on the site

was begun in early October 1972 and the plant is expected to be in operation toward the end of 1974.

19.1.4 Chartered banks

Canada's commercial banking system consists of ten privately owned banks. Eight have been in operation for many years, one commenced operations in July 1968 and another received its charter in November 1972 but had not begun operations by the end of the year. At the end of December 1970, these banks operated 6,200 banking offices in Canada and 270 abroad. Canadian chartered banks engage in a very wide range of activities; they accept various types of deposits from the public including accounts payable on demand, both chequing and non-chequing, notice deposits and fixed-term deposits. The banks, in addition to holding a portfolio of securities, make loans under a wide variety of conditions for commercial, industrial, agricultural and consumer purposes. They also deal in foreign exchange, receive and pay out bank notes, provide safekeeping facilities and perform a variety of other services. For the most part, these operations are carried out in Canada by the extensive network of bank branches. The head offices of the banks confine their activities largely to general administration and policy-making functions, the management of the banks' investment portfolio and related matters. A detailed account of the branch banking system in Canada is given in the *1967 Canada Year Book*, pp. 1126-1128.

All banks operating in Canada are chartered (i.e., licensed) by Parliament under the terms of the Bank Act. The Act regulates certain internal aspects of bank operations such as the auditing of accounts, the issuing of stock, the setting aside of reserves and similar matters. In addition, the Bank Act regulates the banks' relationship with the public, the government and the Bank of Canada.

The Bank Act has been revised at approximately ten-year intervals; the most recent revision was enacted by Parliament early in 1967 and came into effect on May 1 of that year. Increased competition and flexibility in the Canadian banking system were reflected in various new Bank Act provisions. These imposed certain restrictions on corporate and other relationships between banks and other financial institutions, while removing certain existing restrictions on the banks' operations which had placed them at some competitive disadvantage in recent years compared with their principal financial competitors.

In the past, various forms of intercorporate financial relationships between chartered banks and other financial enterprises had developed in Canada. In some instances these involved investment by banks in the shares of these enterprises, and vice versa; in others the relationship involved interlocking directorships. These practices are severely restricted under the terms of the 1967 Bank Act, which limits bank ownership of any Canadian corporation to 10% of the voting shares and also provides that no more than one fifth of the directors of any company may become directors of a bank. In addition, after a two-year period a director of a trust or mortgage loan company which accepts deposits from the public may not be appointed or elected a director of a bank. In order to ensure that competition is not curtailed by agreements among the banks on interest rates to be paid on deposits or charged for loans, the 1967 Bank Act prohibits the making of such agreements (except with the consent of the Minister of Finance). At the same time the provision that was formerly in the Bank Act limiting to 6% the interest rate which chartered banks could charge on loans was abolished effective January 1, 1968. Under the 1967 Bank Act, the determination of interest rates on loans and deposits is left to market forces.

The 1967 Bank Act also granted the banks new mortgage-lending powers, permitting them to charge current rates of interest on mortgage loans under the National Housing Act, and also, for the first time, to make conventional residential mortgage loans. In the case of conventional residential mortgages, the amount of an individual mortgage cannot exceed 75% of the appraised value of the property. After 1973 the maximum amount of a bank's assets to be held in the form of conventional residential mortgages must not be more than 10% of the bank's Canadian dollar deposit liabilities plus debentures. In the interval, the percentage limitation will rise by 1% each fiscal year; it was 4% until October 31, 1968 when it rose to 5% for the subsequent fiscal year and will so continue until the 10% maximum is reached.

The banks have also been given authority to issue their own debentures with an original term to maturity of at least five years; such securities are not subject to reserve requirements and rank in priority after deposit liabilities. The amount of debentures that any bank may have

outstanding is limited by restricting the increase per annum to 10% of the paid-up capital and rest fund and an upper limit of one half of the bank's paid-up capital and rest fund.

The amendments to the Bank Act in 1967 contained a number of revisions respecting the ownership of Canadian chartered banks. No individual or associated shareholders may vote more than 10% of a bank's total shares outstanding and, if more than 25% of a bank's shares are owned by non-residents, the total outstanding liabilities of the bank may not exceed 20 times its authorized capital stock.

The Bank Act also stipulates the minimum statutory cash reserve requirement that the chartered banks must observe. The minimum amount of Bank of Canada notes and deposits each bank must hold as cash reserves was changed in a series of monthly steps from 8% of all Canadian dollar deposits under the old Bank Act to 12% of demand deposits and 4% of other deposits as at February 1968. In addition, the Bank of Canada was given stand-by powers to require the banks to hold a "secondary reserve" which would consist of cash in excess of their statutory requirements, holdings of treasury bills and day-to-day loans to investment dealers. When initially introduced, this secondary reserve cannot exceed 6% of a bank's deposit liabilities. Thereafter it may be increased in monthly steps of 1% to a maximum of 12%. The Bank of Canada may reduce or remove such a secondary reserve at any time. Effective April 1968, the required level was 7%; effective June 1969, it was increased to 8% and, effective July 1970, to 9%; effective December 1971, it was reduced to 8.5% and to 8% effective January 1972.

Chartered bank financial statistics for recent years are given in Tables 19.8 - 19.12; month-end data are available in the *Bank of Canada Review*.

Branches of chartered banks. Although there are fewer chartered banks now than at the beginning of the century, there has been a great increase in the number of branch banking offices. As a result of amalgamations, the number of banks declined from 34 in 1901 to ten in 1931, and remained at that figure until the incorporation of a new bank — The Mercantile Bank of Canada — in 1953 brought the total to 11. Since then the amalgamation in 1955 of the Bank of Toronto and the Dominion Bank as the Toronto Dominion Bank, the amalgamation of Barclays Bank (Canada) with the Imperial Bank of Canada in 1956 and the amalgamation of the Canadian Bank of Commerce and the Imperial Bank of Canada as the Canadian Imperial Bank of Commerce on June 1, 1961 reduced this number to eight. The Bank of British Columbia was granted a charter by Parliament in December 1966 and commenced operations in July 1968. The Unity Bank of Canada was granted a charter in November 1972 and will commence operations in 1973, increasing the number of banks to ten. The number of branches of chartered banks in each province periodically from 1920 to 1972 is given in Table 19.13.

Branches of individual Canadian chartered banks by province and outside Canada as at December 31, 1971-72 are given in Tables 19.14 and 19.15.

Cheque payments. Historical data on a monthly basis are available from 1924 on the amount of cheques charged to customer accounts in 35 major clearing centres. The value of payments rose steadily throughout the country from 1924 to 1929. From 1929 to 1932 the value declined sharply and thereafter fluctuated within rather narrow limits until the outbreak of World War II. Since 1939, the total value of cheques cashed in these centres has increased steadily (see Table 19.16). The value of cheques cashed in 50 clearing centres during 1971 reached a high of \$926,960.0 million, an increase of 13.3% above the value of \$817,910.5 million for 1970. All five geographic regions showed increases, with Ontario recording a gain of 15.3%, the Prairie Provinces 5.0%, the Atlantic Provinces 8.0%, Quebec 14.3% and British Columbia 13.2%. Payments in the two leading centres also reached all-time highs, Toronto advancing 15.0% and Montreal 14.0% over 1970.

19.1.5 Other banking institutions

In addition to the savings departments of the chartered banks and of trust and loan companies, there are provincial government savings banking institutions in Ontario and Alberta, and the Montreal City and District Savings Bank in Quebec, established under federal legislation and reporting monthly to the Department of Finance. Co-operative credit unions also encourage savings and extend small loans to their members.

Province of Ontario Savings Office. The establishment of the Province of Ontario Savings Office was authorized by the Ontario Legislature at the 1921 Session and the first branches were opened in March 1922. Interest at the rate of 5% per annum (as at June 1, 1972),

Financial institutions' assets, 1960-71

compounded half-yearly, is paid on accounts and deposits are repayable on demand. Total deposits as at December 31, 1972 were \$167 million and the number of depositors was approximately 67,500; 21 branches are in operation throughout the province.

Province of Alberta Treasury branches. Deposits are accepted at 74 branches and 78 agencies throughout the province. As at March 31, 1972, deposits totalled \$292.8 million, consisting of demand savings, on which cash orders can be drawn and on which interest is paid at 3½% per annum, \$41.4 million; super savings, permitting personal withdrawals and on which interest is paid at 5% per annum, \$59.4 million; term deposits, for terms ranging from 30 days to five years, bearing interest at rates comparable with those paid on the open market, \$92.1 million; and current accounts, on which no interest is paid, \$99.9 million. Total loans as at March 31, 1971 were \$151.5 million.

The Montreal City and District Savings Bank was founded in 1846 and has operated under a federal charter since 1871. At October 31, 1972, it had a paid-up capital and reserve of \$23.0 million, savings deposits of \$657.2 million and total liabilities of \$701.8 million. Assets of a like amount included \$238.5 million, consisting of federal, provincial, municipal and other securities.

Credit unions. The first credit union in Canada was founded in Lévis, Que., in 1900 to promote thrift by encouraging saving and to provide loans to members who could not get credit elsewhere or could get it only at high interest rates. For many years growth was slow; in 1911, when the first figures were available, assets amounted to \$2 million and by 1940 they were only \$20 million. However, since that time there has been a spectacular increase. Assets of the Quebec credit unions amounted to over \$1,000 million at the end of 1964 and to over \$3,000 million at the end of 1971. In other provinces, credit unions have not attained the same importance as they have in Quebec; the first credit union legislation was passed in Nova Scotia in 1932 followed by legislation in Manitoba and Saskatchewan in 1937 and in Ontario and British Columbia in 1938.

Credit unions are under provincial legislation. Almost all local offices in each province belong to central credit unions operating within the province either directly or through regional unions. There is a considerable difference between Quebec and the other provinces in the asset-holding of credit unions; Quebec unions have a large proportion of their investments in the form of mortgages and government bonds while unions in the other provinces have a greater percentage in loans. Credit unions probably play their most important role in smaller communities where they may function to a large extent as local banks. The number of chartered credit unions in Canada at the end of 1971 was 4,441 which reported a total membership of 5.6 million and assets of \$5,588 million (Table 19.17). Quebec, with 3.2 million members and assets of \$3,046 million accounted for 57% and 54%, respectively, of total membership and total assets of all credit unions in Canada. Credit unions classified by bond of association on a percentage basis were: occupational 27, residential 61 and associational 12.

Canadian credit unions in the 1961-71 decade have continued their steady growth (Table 19.18). Loans granted by credit unions increased by 2.7% in 1971 to reach \$1,829 million, being a 217% increase over the corresponding figure of \$570 million in 1961. Assets at \$5,588 million increased by 205% and savings at \$5,159 million increased by 225% in the same comparison. Membership of 5.6 million represented 25% of the total population, compared with 2.8 million and 15%, respectively, in 1961. Assets, liabilities and members' equity of local credit unions in Canada are given in Table 19.19.

There were 20 central credit unions in 1971; these unions act as credit unions for the credit unions, mainly by accepting deposits of surplus funds from them and providing a source of funds for them to borrow when they cannot meet the demand for local loans. Most of the centrals also admit co-operatives as members. Total assets of the centrals increased by 29% to \$852 million and loans to members increased 2% to \$478 million over the previous year. The Canadian Co-operative Credit Society serves as a central credit union for the provincial centrals and large co-operatives all across Canada.

19.2 Other financial institutions

19.2.1 Trust and mortgage companies

Trust and mortgage companies are registered with either the federal or provincial governments. They operate under the Loan Companies Act (RSC 1970, c.L-12) and the Trust Companies Act (RSC 1970, c.T-16, as amended) or under corresponding provincial legislation.

Trust companies operate as financial intermediaries in the same way as mortgage companies, chartered banks or savings and other financial institutions and are the only corporations in Canada with power to act as trustees for property interests and to conduct other fiduciary business. In this capacity they act as executors, trustees and administrators under wills or by appointment, as trustees under marriage or other settlements, as agents in the management of estates of the living, as guardians of minor or incapable persons, as financial agents for municipalities and companies, as transfer agents and registrars for stock and bond issues, as trustees for bond issues and, where so appointed, as authorized trustees in bankruptcies.

Trust and mortgage companies were established and grew rapidly under provincial

legislation in the late nineteenth and early twentieth centuries. Some companies were chartered by special Acts of Parliament but it was not until 1914 that the federal government began to regulate trust and mortgage companies registered under its Acts. In 1970 there were nine federal trust companies and 13 federal mortgage companies. The Superintendent of Insurance examines these companies and also, by arrangement with the provinces, trust and mortgage companies incorporated in Nova Scotia and trust companies incorporated in New Brunswick and Manitoba. Companies must be licensed by each province in which they wish to operate.

Although there are many differences among the various federal and provincial Acts, the broad lines of the legislation are common. In their intermediary business the companies have the powers mentioned above to borrow or, in the case of trust companies, accept funds in guaranteed accounts subject to maximum permitted ratios of these funds to shareholders' equity. The funds may be invested in specified assets which include first mortgages on real property, government securities, and the bonds and equity of corporations having established earnings records, and the companies may grant loans on the security of such bonds and stocks and unsecured personal loans. Trust and mortgage companies are not required to hold specified cash reserves, as are the chartered and savings banks, but there are broadly defined "liquid asset" requirements in a number of the Acts.

In the 1920s trust and mortgage companies held about one half of the private mortgage business in Canada but their growth rate fell off sharply because of the effect on the mortgage business of the depression and World War II. In the years since then the strong demand for mortgage financing has led to sustained rapid expansion.

At the end of 1971, total assets net of investment in subsidiaries of trust companies in the Statistics Canada survey were \$7,403 million compared with \$6,514 million a year earlier, an increase of 14%. Trust companies, while not specializing in mortgage financing, have been putting a high proportion of their funds into these investments with the result that mortgages represented 60% of their total assets at the end of 1971. The trust companies had \$5,126 million in term deposits outstanding and \$1,684 million in demand deposits at the end of 1971, accounting for 91% of total funds. About one third of the demand or savings deposits were in chequable accounts. There is considerable variety among the trust companies and a few have developed a substantial short-term business, raising funds by issuing certificates for terms as short as 30 days and also operating as lenders in the money market. Nevertheless, it remains true that the main business of the trust companies in their intermediary role is to channel savings into mortgages and other long-term investments. In addition, trust companies, as at December 31, 1971 had \$24,645 million under administration in estate, trust and agency accounts. Summary statistics are given in Tables 19.20 - 19.22.

Mortgage companies had assets before investment in subsidiaries of \$3,864 million at the end of 1971 compared with \$3,428 million a year earlier. Their holdings of mortgages amounted to \$3,152 million, or 82% of total assets. To finance their investments, these companies had borrowed \$2,700 million or 70% of their total funds by the sale of debentures and \$546 million from demand deposits.

More complete and up-to-date financial information may be found in quarterly financial statements published by Statistics Canada and the Bank of Canada, the reports of the Superintendent of Insurance on loan and trust companies and the reports of provincial supervisory authorities.

19.2.2 Small loans companies

Small loans companies and money-lenders are subject to the Small Loans Act (RSC 1970, c.S-11). This Act, first passed in 1939, sets maximum charges on personal cash loans not in excess of \$1,500 and is administered by the Department of Insurance. Lenders not licensed under the Act may not charge more than 1% per month. Those wishing to make small loans at higher rates must be licensed each year by the Minister of Finance under the Small Loans Act. The Act allows maximum rates, including charges of every kind, of 2% per month on unpaid balances not exceeding \$300, 1% per month on the portion of unpaid balances exceeding \$300 but not exceeding \$1,000 and one half of 1% on any remainder of the balance exceeding \$1,000. Loans in excess of \$1,500 are not regulated and lenders operating entirely above this limit and the larger loans of licensed lenders are thus exempt from the Act. Nor does the Act regulate charges for the instalment financing of sales. Prior to January 1, 1957, the Act applied only to

loans of \$500 or less and the maximum interest charge allowed was 2% per month.

At the end of 1971, there were five small loans companies and 40 money-lenders licensed under the Act. Small loans companies are incorporated federally; money-lenders include provincially incorporated companies. Many of the small loans companies and money-lenders are affiliated with other financial institutions, principally Canadian sales finance companies and United States finance or loan companies. The affiliations with sales finance companies reflect the close relationship between instalment financing and the consumer loan business.

Statistics Canada publishes quarterly balance sheets for sales finance and consumer loan companies as a whole and does not attempt to distinguish the two groups within the industry (see *Financial institutions*, Catalogue No. 61-006).

The subsidiary small loans companies and money-lenders obtain most of their funds through their parent companies. A few of the larger companies have supplemented their bank loans by selling short-term paper in the market but the amount has been small compared with the short-term market borrowing of the sales finance companies. The smaller independent companies rely mainly on their shareholders and on borrowing from the chartered banks.

Annual figures of assets and liabilities given in Table 19.23 for 1968-71 are from the Department of Insurance report. More complete data on the business of licensed lenders are given in the report on small loans companies and money-lenders, published annually by the Superintendent of Insurance.

There was a marked decrease in 1971 compared with 1970 in the number and amount of small loans made by the combined companies. Small loans made to the public during the year numbered 917,652 as against 1.0 million in 1970, a drop of about 11%; the amount of such loans decreased from \$637.1 million to \$573.2 million, a drop of about 10%. The average small loan made was \$625 in 1971 and \$621 in 1970. At the end of the year, small loans outstanding numbered 875,366 for an amount of \$439.6 million, or an average of \$502 per loan; comparable figures for 1970 were 1.0 million, \$524.8 million and \$505, respectively.

Gross profits of small loans companies and money-lenders before income taxes and before taking into account any increase or decrease in reserves for bad debts increased from \$55.9 million in 1970 (\$2.5 million being the profit on small loans and \$53.4 million the profit on business other than small loans) to \$59.8 million in 1971 (\$233,000 being the profit on small loans and \$59.6 million the profit on other business).

19.2.3 Foreign exchange

The dollar was established as the official currency of the united provinces of Canada on January 1, 1858, and extended to cover the new Dominion by the Uniform Currency Act of 1870. The gold sovereign remained the standard for the Canadian dollar until 1910 when the currency was defined in terms of fine gold, making it the exact gold equivalent of the United States dollar. Both British and US gold coins, however, were legal tender in Canada during this period.

The 1870 Act defined the Canadian dollar as 15/73 of the British gold sovereign, that is, the par rate of exchange between the dollar and the pound sterling was fixed at \$4.866, making the Canadian currency the equivalent of the US dollar at parity. With minor variations the value of the pound sterling in Canada remained at this level until 1914.

For a complete description of the fluctuations between the Canadian and US dollars up to 1950 see the *1972 Canada Year Book*, pp. 1252-1254.

On September 30, 1950, the Minister of Finance announced that official fixed foreign exchange rates which had been in effect at varying levels since 1939 would be withdrawn effective October 2, and that the rate would henceforth be determined in the market for foreign exchange. This policy was carried out within the framework of exchange control until December 14, 1951, at which time the Foreign Exchange Control regulations were revoked by the Governor in Council, terminating the period of exchange control that had prevailed in Canada since 1939. The Foreign Exchange Control Act was repealed in 1952. On May 2, 1962, the Minister of Finance announced that the Canadian dollar was being stabilized at a fixed par value of 92½ cents in terms of United States currency. This action was taken with the concurrence of the International Monetary Fund (IMF) and, in accordance with the Articles of Agreement of that organization, the Government of Canada undertook to maintain the Canadian exchange rate within a margin of 1% on either side of the established par value.

On May 31, 1970, the Government of Canada announced a decision not to maintain the

exchange rate of the Canadian dollar within the 1% parity band prescribed by the IMF for the time being. The movements of the US dollar in Canadian funds from January 1965 to December 1972 are shown in Table 19.24. Details of Canada's official international reserves and exchange fund account are presented in Table 19.25.

19.2.4 The bond market

Sales of Canadian bonds. A net total of \$6,514 million was raised in the bond market by all three levels of government in Canada as well as Canadian corporate borrowers in 1971, about \$650 million more than that raised in 1970. Major bond borrowers were the Government of Canada and provincial governments, recording net new issues of \$2,531 million and \$2,253 million, respectively.

The \$2,253 million of new issues of provincial governments included \$915 million purchased by the Canada Pension Plan Investment Fund and about \$174 million through the Quebec Pension Plan. Net new market issues of municipal government bonds amounted to \$199 million. Corporations resorted to bond financing to the extent of \$1,475 million and other institutions had net new issues in 1971 of \$56 million.

Government of Canada bonds for terms of ten years and over yielded 6.56% at the end of December 31, 1971 compared to 6.99% a year earlier. Comparable figures for provincial issues were 7.75% and 8.25%, and for those of municipalities, 7.85% and 8.74%.

There was an increase of \$188 million in finance and loan company paper, and of \$8 million in bankers' acceptances in 1971. Yields on 90-day finance company paper at 4.32% at the end of 1971 were considerably lower than the 5.50% a year earlier.

Bonds outstanding. Total government and business bonds outstanding at the end of 1971 amounted to \$77,034 million, an increase of 9% over 1970 and 48% since 1966. In the 1966-71 period, the largest increase was one of 77% in the bonded debt of provincial governments. This increase includes issues held in the Canada Pension Plan Investment Fund and the Quebec Deposit and Investment Fund since the inception of the plans in 1966. Corporate bonds outstanding increased by 49% and municipal government bonds by 24% between 1966 and 1971 (Table 19.26).

Distribution of bond holdings. Table 19.27 shows the estimated distribution as at December 31, 1971 of government and corporate bonds among the major purchasers of securities. Governments and the financial institutions specified in the Table held more than one half of the total; of the remainder, non-residents held about 19% and all other residents held 28%. Of the 28%, however, 13% was made up of Canada Savings Bonds. The largest identified holders of bonds were chartered banks with 12% of total, trustee pension plans with 8% and life insurance companies with 7%.

19.3 Insurance

Insurance business is transacted in Canada by about 900 companies and societies. All of them are licensed or registered by provincial insurance authorities; at the end of 1971, 435 were also registered by the federal Department of Insurance. Details of the classes of insurance each company or society is authorized to transact and statistical information may be found in the various published reports of the individual superintendents of insurance for the provinces. Financial statistics of the federally registered companies and fraternal benefit societies are published in the annual three-volume *Report of the Superintendent of Insurance for Canada*.

19.3.1 Life insurance

Total life insurance in force in Canada at the end of 1971 amounted to \$133,345 million of which about 92% was written by federally registered companies and fraternal benefit societies. The remainder was written by companies and societies that were provincially licensed only.

At the end of 1971, 134 companies were registered by the federal Department of Insurance to transact life insurance (50 Canadian, 13 British and 71 foreign). There were also 46 registered fraternal benefit societies (15 Canadian and 31 foreign).

The business of federally registered companies in Canada grew from \$91 million in 1880 to \$121,891 million at the end of 1971. Table 19.28 gives figures since 1880 for amounts of new insurance effected during the indicated year and an analysis of amounts in force at the end of the year among Canadian, British and foreign companies. Canadian companies reported an additional \$35,275 million amounts in force out of Canada at the end of 1971.

Per capita ownership of life insurance, by province and by type of insurance, end of 1971

During 1971, there were over 678,000 new policies effected with a value of nearly \$16,000 million. Over 130,000 policies ceased by death or maturity with a value of over \$528 million. Tables 19.29 and 19.30 compare newly effected written business and total amounts in force for 1970 and 1971.

Net insurance premiums written in 1971 totalled \$1,435 million as compared with \$1,349 million in 1970. Net insurance claims (death, disability and maturity) totalled \$546 million in 1971 as compared with \$513 million in 1970. Table 19.31 gives a provincial analysis of the premium income in 1971 on a direct written basis.

Assets of Canadian life insurance companies on a world-wide basis totalled over \$17,000 million at the end of 1971. Assets of British companies applicable to business in Canada, on deposit with the Receiver General, vested in trust or secured by policies in Canada, totalled \$1,266 million. Those of foreign companies on a similar basis totalled \$2,585 million. In addition, there were assets under the control of the Chief Agent in Canada: \$71 million for British companies and \$86 million for foreign companies. The major categories of assets and related liabilities for 1970 and 1971 are given in Table 19.32.

Total income of Canadian companies amounted to \$3,284 million of which \$733 million was applicable to out-of-Canada business. The income of British companies applicable to Canadian business totalled \$252 million; and of foreign companies, \$601 million. The major sources of income and selected expenditures are given in Table 19.33.

For registered fraternal benefit societies, the certificates in force in Canada totalled \$2,204 million at the end of 1971, as compared to \$1,925 million at the end of 1970. Premiums written in Canada totalled \$34,908 million during 1971, of which \$27,765 million was applicable to Canadian societies and \$7,143 million to foreign societies. Canadian societies also reported \$56,908 million in premiums written out of Canada.

Preliminary figures, subject to change, showing the results of the insurance business in Canada for the year 1972 as transacted by insurance companies and fraternal societies registered with the Department of Insurance at Ottawa have now been compiled from the annual statements filed with the Department.

For life insurance companies, the net amount of life insurance effected in Canada during 1972 was \$17,547 million, an increase over 1971 of \$1,607 million or 10%. Of this amount,

individual insurance amounted to \$9,721 million and group insurance to \$7,826 million. The net amount of life insurance in force in Canada on December 31, 1972, was \$135,431 million, an increase over the corresponding amount in force at the end of 1971 of \$13,540 million or 11%. Of this amount, individual insurance amounted to \$66,237 million and group insurance to \$69,194 million. Canadian companies carried \$95,714 million. British companies \$6,944 million and foreign companies \$32,773 million.

The net insurance premium income for life insurance companies in Canada during 1972 was \$1,510 million and the net annuity considerations were \$749 million (including amounts received from policyholders for segregated funds). For the year 1971, these figures were \$1,435 million and \$578 million, respectively.

For fraternal societies, the net amount of life insurance in force in Canada on December 31, 1972 was \$1,459 million, a decrease over 1971 of \$745 million or 34%. Canadian societies carried \$1,248 million and foreign societies \$211 million.

19.3.2 Fire and casualty insurance

Premiums written in Canada for property insurance, automobile insurance, personal accident and sickness insurance, liability insurance and other forms of casualty insurance (excluding marine insurance) totalled \$2,435 million of which about 84% was written by federally registered companies. The remainder was written by other provincially licensed companies including a large number of parish, municipal, county and farmers' mutuals, by Lloyd's and by provincial government insurance offices.

At the end of 1971, there were 358 companies (121 Canadian, 50 British and 187 foreign) registered by the federal Department of Insurance to transact other than life insurance. Of these, 103 were life companies whose non-life business was ordinarily only personal accident and sickness insurance.

For federally registered companies, the premium income on a net basis has increased from just under \$4 million in 1880 to \$2,013 million in 1971. An analysis of premiums and related total claims by class of insurance (including marine) is given in Table 19.34 and by province in Table 19.35.

Assets of Canadian fire and casualty companies on a world-wide basis totalled \$1,632 million at the end of 1971. Assets of British companies applicable to their in-Canada business, on deposit with the Receiver General or vested in trust, totalled \$391 million. Those of foreign companies on a similar basis totalled \$1,024 million. In addition, there were assets under the control of the Chief Agent in Canada: \$143 million for British companies and \$246 million for foreign companies. The major categories of the assets and their related liabilities for 1970 and 1971 are given in Table 19.36.

Underwriting experience in Canada over the past ten years has ranged from a loss of \$67 million in 1963 to a gain of \$51 million in 1967. The loss for 1971 was nearly \$34 million.

Preliminary statistics for 1972. (See Table 19.37.) Property insurance net premiums written in Canada during 1972 were \$586 million, an increase over 1971 of \$55 million or 10%. The net premiums earned in 1972 were \$558 million and the net claims incurred were \$343 million indicating a claims ratio of 62%. The claims ratio for 1971 was 60%. Net premiums for automobile insurance written in Canada during 1972 were \$981 million, an increase over 1971 of \$84 million or 9%. The net premiums earned in 1972 were \$943 million and the net claims incurred were \$711 million, indicating a claims ratio of 75%. The claims ratio for 1971 was 71%.

Personal accident and sickness insurance net premiums written in Canada during 1972 were \$478 million, an increase over 1971 of \$75 million or 19%. The net premiums earned in 1972 were \$460 million and the net claims incurred were \$364 million indicating a claims ratio of 79%. The claims ratio for 1971 was 79%. Net premiums for liability insurance written in Canada during 1972 were \$111 million, an increase over 1971 of \$17 million or 18%. The net premiums earned in 1972 were \$105 million and net claims incurred were \$60 million indicating a claims ratio of 57%. The claims ratio for 1971 was 63%.

19.3.3 Fire losses

In 1971 the number of fires reported in Canada increased to 72,729 from 67,719 in 1970 and 64,914 in 1969, but decreased compared with the 83,706 and 85,585 fires reported in 1961 and 1962. Fires in 1971 resulted in 739 deaths and property losses totalling \$236 million or \$10.89 per capita (Tables 19.38 and 19.39). Federal government property losses are now included in the provincial figures.

19.3.4 Government insurance

19.3.4.1 Federal government insurance

In recent years, various insurance schemes have been adopted by the federal government or undertaken co-operatively by the federal and provincial governments. Information on unemployment insurance, hospital insurance, veterans insurance, export credit insurance, etc., will be found in the appropriate Chapters on Labour, Health and welfare, Foreign trade, etc.

Deposit insurance. The Canada Deposit Insurance Corporation was established in 1967 to provide, for the benefit of persons having deposits with a member of the Corporation, insurance against the loss of deposits up to a maximum of \$20,000 for any one depositor. Membership in the Deposit Insurance Corporation is obligatory for chartered banks, Quebec savings banks and those federally incorporated loan and trust companies that accept deposits from the public. Provincially incorporated loan and trust companies that accept deposits from the public are eligible to apply for membership if they have the consent of the province of incorporation. The definition of deposits, as set out in the general by-law of the Corporation, might be summarized as money received by a member institution that is repayable on demand or notice and money that is repayable on a fixed date not more than five years after the date on which the money is received. Deposits not payable in Canada or in Canadian currency are not insured.

19.3.4.2 Provincial government insurance

Manitoba. The Manitoba Public Insurance Corporation is a Crown corporation established under the Automobile Insurance Act. The Act was proclaimed on September 21, 1970, and the Corporation was created by order of the Lieutenant-Governor in Council on September 29, 1970. The Act and its Regulations provide for the establishment of a universal, compulsory automobile insurance plan and of other plans of automobile insurance within the province.

The plan, known as Autopac, provides the following basic coverage on Manitoba-licensed motor vehicles: (1) bodily injury (including passenger hazard) and property damage liability to \$50,000; no-fault all-perils coverage with \$200 deductible and nil deductible for total loss covered by fire, lightning or theft of the entire vehicle; if a vehicle is stolen, the owner may be reimbursed for transportation expenses up to \$8 a day for up to 30 days; and (2) no-fault personal injury benefits (paid automatically without limiting the insured's right to seek a larger settlement); death benefits to a maximum of \$10,000; funeral expenses to a maximum of \$500; benefits up to \$6,000 for dismemberment, disfigurement, or impairment; loss-of-income payment of \$50 a week for total disability and \$25 a week for partial disability, beginning one week after disability; for a total disability, payments continue for the period during which the insured remains totally disabled, with no time limit, and for partial disability, payments continue up to 104 weeks.

Revenue for the plan comes from two sources — premiums on driver licences and premiums on vehicles. Premiums on driver licences recognize driver responsibility; a driver is allowed to accumulate five demerit points (based on driving infractions) before being assessed an additional driver-insurance premium. Premiums on vehicles are based on such factors as year, make, model, use and rating territory, based on the address of the vehicle owner.

The plan was inaugurated November 1, 1971 for an initial four-month period; thereafter, it operates concurrently with the 12-month vehicle registration period which is March 1 through the following February 28.

Saskatchewan. The Saskatchewan Government Insurance Office, a Crown corporation established by the Saskatchewan Government Insurance Act, 1944, commenced business in May 1945. It provides all types of insurance other than sickness and life. The aim of the legislation is to provide residents of the province with low-cost insurance designed for their particular needs. Rates are based on loss experience in Saskatchewan only and the surplus is invested, to the extent possible, within the province. Premium income for 1972 amounted to \$21.2 million and earned surplus amounted to \$44,294. The total amount made available to the Saskatchewan Government Finance Office from 1945 to December 31, 1972 was \$10 million. Assets at the latter date were \$55.5 million of which \$28 million was invested in bonds and debentures issued by the province and by Saskatchewan municipalities, hospitals and schools. Independent insurance agents, numbering 554, sell insurance throughout the province on behalf of the Office.

The Automobile Accident Insurance Act, administered by the Saskatchewan Government Insurance Office on behalf of the provincial government, provides a comprehensive automobile accident insurance plan for the protection of the public in the province. Premiums paid by motorists create a fund from which benefits are paid in the event of death, injury or damages sustained in automobile accidents. Any surplus over payments is used to increase benefits, reduce premiums or absorb deficits in periods of high accident frequency. The surplus is not transferable to the general operation of the Saskatchewan Government Insurance Office, nor is any surplus credited to the provincial government. The plan provides protection against loss arising out of a motorist's liability to pay for bodily injury or death of others and damage to property of others, up to a limit of \$35,000, regardless of the number of claims arising from any one accident. Comprehensive coverage, including collision and upset, subject to \$200 deductible for private passenger cars and farm trucks is also provided. Rates vary from \$6 to \$104 for private passenger cars and \$5 to \$45 for farm trucks. There are various rates for other types of motor vehicles depending on size and usage. From the inception of the Act in 1946 to December 31, 1972 more than \$235 million was paid in claims.

The Saskatchewan Government Insurance Office, under contract with the Saskatchewan Department of Natural Resources, offers insurance to farmers covering damage to unharvested crops by certain wildlife such as ducks, geese, sandhill cranes, deer, elk, bear and antelope.

Alberta. Provincial government insurance in Alberta, coming within the purview of the Alberta Insurance Act, relates to the Alberta General Insurance Company, in which the entire business of the fire branch of the Alberta Government Insurance Office was vested by the Legislature on March 31, 1948, and to the Life Insurance Company of Alberta, which was constituted on the same date to take over the life branch of the Alberta Government Insurance Office. Each company is administered by a separate board of directors. The Lieutenant-Governor in Council appoints the members to the respective boards but the charter of the Life Insurance Company of Alberta provides for the election of two policyholder directors. Although both companies are Crown corporations, they are not entitled to the usual immunities of the Crown, since they may sue and be sued in any court of competent jurisdiction.

A variety of agencies in Alberta offer forms of prepaid protection corresponding to insurance but the nature of the enabling legislation governing these plans emphasizes the fact that they do not constitute insurance. Because such exemptions are specifically provided by the insurance laws of the province, reference to these plans is necessary only to make it clear that they do not come within the scope of the Alberta Insurance Act. It should be noted that the Alberta Hail Insurance Act and the Alberta Crop Insurance Act are administered by the Alberta Hail and Crop Insurance Corporation and each contains a clause exempting its operations from the provisions of the Alberta Insurance Act.

1972	1,615	686	2,301	36,951	6.2

Bank of Canada deposits are averages of the juridical days in the month shown; Bank of Canada notes and Canadian dollar deposits are averages of the four consecutive Wednesdays ending with the second last Wednesday in the previous month. Until June 1967 the required cash reserve ratio was 8% on both demand and notice deposits. For the next eight months the required minimum monthly average on demand deposits was increased by $\frac{1}{2}$ of 1% per month and that on notice deposits was decreased by $\frac{1}{2}$ of 1%. Since February 1968 the required ratios have been 12% for demand deposits and 4% for notice deposits as prescribed under the Bank Act.

19.10 Classification of chartered bank deposit liabilities payable to the public in Canada in Canadian currency, as at Apr. 30, 1971 and 1972 (number of accounts)

Deposit accounts of the public of:	1971			1972		
	Personal savings deposit accounts	Other deposit accounts of the public	Total deposit accounts of the public	Personal savings deposit accounts	Other deposit accounts of the public	Total deposit accounts of the public
Less than \$100	7,380,380	2,482,432	9,862,812	7,504,833	2,517,582	10,022,415

1972	4,355.0	12.6	505.2	834.1	342.9	6,049.9	-2.5

¹ Convertible foreign currency holdings of the Exchange Fund Account, the Receiver General for Canada and the Bank of Canada.

² Valued at official parity rates in terms of US dollars.

³ Holdings of Special Drawing Rights (SDRs) reflect allocations to Canada of SDRs and transactions involving Canada under the arrangements by the International Monetary Fund providing for the use of SDRs by member countries.

⁴ Includes all overnight and forward transactions of the Exchange Fund Account and the Bank of Canada that affect the total of official reserves. A positive figure indicates a net commitment to take delivery of foreign exchange in the future and a negative figure indicates a commitment to deliver foreign exchange in the future.

19.26 Canadian bonds outstanding as at Dec. 31, 1966-71, and annual changes in bonds and in short-term paper outstanding (million dollars)

Chapter 20

Government finance

20.1 Consolidated finance statistics

Details of consolidated government revenue by source, and consolidated government expenditure by function for the years 1965-69 are presented in Table 20.1. The consolidation reflects the relationship between government at all levels and the public in respect of revenue raised and services provided. The consolidated gross general figures were arrived at by eliminating from the gross general revenue sources and the gross general expenditure functions of each level of government, all general purpose transfers such as the federal statutory subsidies and equalization payments to the provinces, and all specific purpose transfers such as the federal contributions to provincial hospitalization and medical care programs. Both gross revenues and expenditures continued to increase over the period but after a peak deficit in 1967 the differential continued to decline through 1968 to reach a figure of -\$43.5 million in 1969.

20.2 Federal government finance

20.2.1 General accounts

Tables 20.2 to 20.6 present financial statistics of the federal government prepared in accordance with the revised financial management concepts as published in the Statistics Canada publication *The Canadian system of government financial management statistics* (Catalogue No. 68-506). Financial statistics in Tables 20.7 and 20.8 are extracted directly from the *Public accounts of Canada*.

Tables 20.2 and 20.3 give details of gross general revenue and expenditure for the years ended March 31, 1970 and 1971. Revenue increased from \$15,825 million to \$16,642 million while expenditures rose from \$13,767 million to \$15,728 million.

Transfers from the federal government to provincial governments, territories and local governments for the year ended March 31, 1971 are shown in Table 20.4. Comparable figures for the previous year are available in the *1972 Canada Year Book* pp. 1139-1142.

Table 20.5 provides details of the assets and liabilities of the federal government as at March 31, 1970 and 1971. Table 20.6 provides an analysis of the gross bonded debt according to average interest rate, average term of issue and place of payment as at March 31, 1970-72.

In addition to the direct gross bonded debt, the Government of Canada has assumed certain contingent liabilities. The major categories of this indirect or contingent debt are the guarantee of insured loans under the National Housing Act and the guaranteed bonds and debentures of the Canadian National Railways. The remainder consists chiefly of guarantees of loans made by chartered banks to the Canadian Wheat Board, to farmers and to university students and of guarantees under the Export Development Act. Table 20.7 provides detail of the guaranteed debt of the Government of Canada as at March 31, 1972.

Table 20.8 summarizes the public debt position during the period 1968-72 as to interest and amount outstanding. Details of unmatured debt and treasury bills outstanding and information on new security issues of the federal government may be found in the *Public accounts of Canada*. They are summarized by standard classification in Statistics Canada publication *Federal government finance* (Catalogue No. 68-211).

20.2.2 Individual and corporation taxes

Statistics of income tax collections are gathered at the time the payments are made and are therefore up to date. Over 85% of individual taxpayers are wage or salary earners who have almost the whole of their tax liability deducted at the source by their employers. All other taxpayers are required to pay most of their estimated tax during the taxation year. Thus, the greater part of the tax is collected during the same year in which the related income is earned and only a limited residue remains to be collected when the returns are filed. The collections for a given fiscal year include employer remittances of tax deductions, Canada Pension Plan contributions, unemployment insurance premiums and instalments, embracing portions of two or more taxation years, and year-end payments; they cannot therefore be closely related to the statistics for a given taxation year. As little information about a taxpayer is received when

the payment is made and as a single cheque from one employer may frequently cover the tax payment of hundreds of employees, the payments cannot be statistically related to taxpayers by occupation or income. Descriptive classifications of taxpayers are available only from tax returns but collection statistics, if interpreted with the current tax structure and the above factors in mind, indicate the trend of income in advance of the final compilation of statistics. The statistics given in Table 20.9 pertain to revenue collections by the Department of National Revenue, Taxation. The collections are for fiscal years ended March 31.

Individual income tax statistics collected by Statistics Canada are presented in Tables 20.10 - 20.12 on a calendar-year basis and are compiled from a sample of all returns received. Taxpayers and amounts of income and tax are shown for selected cities and by occupational class and income classes.

Table 20.13 gives statistics of corporation positive income tax by industry group by size of assets for 1968-70. Federal and provincial income taxes payable by corporations by industrial division are summarized in Table 20.14.

20.2.3 Estate taxes

From January 1, 1947 to March 31, 1963, only Ontario and Quebec levied succession duties, the other provinces having leased this field to the federal government under the terms of the federal-provincial tax agreements. However, British Columbia re-entered the field, effective for all deaths occurring on or after April 1, 1963. The incidence of the estate tax since that time is described in Section 20.6. Federal revenue from succession duties and estate taxes in the year ended March 31, 1972 amounted to \$132.0 million. In the same year, provincial revenues from succession duties in Quebec, Ontario and British Columbia were \$48.0 million, \$81.3 million and \$28.7 million, respectively.

20.2.4 Excise taxes

Excise taxes collected by the Excise Division of the Department of National Revenue are given for the years ended March 31, 1970-72 in Table 20.15.

Excise duties. Gross excise duties collected for the year ended March 31, 1972 were: spirits \$235.2 million; beer or malt liquor \$160.6 million; tobacco, cigarettes and cigars \$221.4 million; licences \$35,271; for a total of \$617.3 million. A drawback of 99% of the duty may be granted when domestic spirits, testing not less than 50% over proof, are delivered in limited quantities for medicinal or research purposes to universities, scientific or research laboratories, public hospitals or health institutions in receipt of federal and provincial government aid.

20.3 Federal-provincial programs

Federal expenditures on joint federal-provincial programs, which, beginning in 1969-70, experienced a startling rate of increase, continued to increase during the fiscal year April 1, 1971 to March 31, 1972. These programs take three forms: the federal government contributes financial assistance to a program administered by a province; the federal and provincial governments each assumes the sole responsibility for the construction, administration and financing of separate aspects of a joint project; or the province contributes financially to a joint program administered by the federal government.

The first category of joint programs is by far the most common and such programs are commonly called conditional grant programs. They are characterized by the federal government agreeing to make money available to a province on certain conditions, such conditions always specifying the field, service or project to which the money must be applied. In addition to administering the programs, the provinces may be required to make financial contributions to them to provide certain facilities and to meet certain specified standards of operation. Various programs in the field of social policy are conditional grant programs. For instance, the federal government undertakes to contribute to participating provinces a specified share of the costs incurred by the provinces in respect of public hospital insurance programs. The federal contribution in each province is equal to 25% of the average per capita cost of in-patient services in Canada as a whole plus 25% of the average per capita cost of in-patient services in the province multiplied by the average for the year of the number of insured persons in the province.

Although the hospital insurance program, with its specifications of eligible hospitals, sharable costs and the amount of the federal contribution, is characteristic of many conditional

grant programs there are others in which the conditions are nominal. For example, under the Canada Assistance Plan the federal government undertakes to share one half of the cost of welfare paid to recipients in need, the scale and conditions of the assistance to be determined by the provinces. In general, it may be said that the hospital insurance program conforms to the traditional pattern of conditional grants, whereas the Canada Assistance Plan marks an approach in which flexibility and adaptability to local circumstances are allowed to modify insistence on a national uniform standard.

Joint programs in the second category — those in which the federal and provincial governments accept sole responsibility for portions of a total project — are not numerous and are generally of a public works nature. The irrigation projects carried out jointly by the Prairie Farm Rehabilitation Administration and the province of Alberta on the St. Mary's and Bow rivers in southern Alberta were of this nature.

Joint programs in the third category are also few in number and the sums of money involved are seldom large. The South Saskatchewan River dam was an example; Canada undertook to pay the costs of the dam in the first instance, with Saskatchewan subsequently reimbursing Canada for one quarter of the federal expenditures (up to a maximum of \$25 million) on the dam and reservoir. By March 31, 1968, the full amount had been recovered from Saskatchewan.

The federal transfers to the provinces in respect of the conditional grant and shared-cost programs increased from \$75 million in the year ended March 31, 1954, to \$3,099.6 million in 1971-72. The increase was attributable largely to the introduction of the hospital insurance and diagnostic services program in 1958, medicare in 1968, increases in the level of assistance, and the integration of welfare programs under the Canada Assistance Plan. In 1971-72, federal contributions to the programs in respect of hospital and diagnostic services, medicare, and welfare programs integrated with and into the Canada Assistance Plan amounted to \$1,216.4 million, \$575.5 million and \$735.3 million, respectively. Further details are given in Table 20.16.

The increasing number and extent of conditional grant and shared-cost programs has occasioned some provincial criticisms and misgivings. It has been argued that the preponderant occupancy of the direct tax field in the postwar years by the federal government encouraged the growth of such programs, as the provinces were denied the revenues that would have enabled them to provide equivalent programs themselves. At the 1964 Federal-Provincial Conference, Quebec proposed that a province be given the option to assume full administrative and financial responsibility for certain joint programs upon the federal government making available to that province the necessary additional tax room. These proposals were referred to a federal-provincial committee of officials for consideration. As a consequence of their consideration, the Prime Minister of Canada, in a letter to the provincial Premiers dated August 15, 1964, proposed a temporary measure permitting a province for an interim period to assume full financial and administrative responsibility in respect of certain programs pending the development of more permanent arrangements. Parliament approved the necessary legislation — the Established Programs (Interim Arrangements) Act — in April 1965. Under the Act, the Government of Canada was authorized to enter into agreements with any province that wished to assume full financial and administrative responsibility for certain programs in return for fiscal compensation. The nature and number of programs were itemized in the schedules to the Act.

Schedule I listed the major conditional grant programs of a continuing nature and Schedule II listed smaller and more transient programs. The Schedule I programs were: hospital insurance; old age assistance, blind persons' allowances, disabled persons' allowances, and the welfare portion of unemployment assistance; the technical and vocational training programs for youths who were not yet members of the labour force; and the health grant program, except those elements that involved research and demonstration. The Schedule II programs were: agricultural lime assistance; forestry programs; hospital construction grants; campgrounds and picnic areas; and the roads-to-resources program. The Act was subsequently amended to include the Canada Assistance Plan.

If a province wished to avail itself of the provisions of the Established Programs (Interim Arrangements) Act in respect of a Schedule I program, it had to enter into a supplemental agreement in which it undertook to assume full responsibility for the administration and financing of the program. The federal government undertook to ensure that the province

Government sector revenue and expenditure by level of government

National income and expenditure accounts basis
(Quarterly, seasonally adjusted at annual rates)

Federal government¹

Provincial — Municipal governments³

1. Excludes Canada Pension Plan and Quebec Pension Plan.
2. Includes transfers to other levels
3. Includes hospitals.
4. Excludes all intergovernmental transfers except federal to provincial and municipal

received revenue equivalent to the fiscal burden it assumed. The federal government undertook to: abate by a specified percentage the individual income tax on the income of residents of the province; pay associated equalization; and make an operating cost adjustment. The operating cost adjustment payment or recovery was to ensure that a province did not suffer or benefit financially through assuming the financing of the federal share of the former joint program. Because of their smaller size and lack of continuity, the compensation associated with a Schedule II program did not provide for federal tax abatement or associated equalization payments. Compensation for these programs was to be paid directly to the province by the federal Minister of Finance.

The freedom of a province to vary the nature and condition of a program enumerated in the Established Programs (Interim Arrangements) Act differed between the Schedule I and Schedule II programs. Under the Act, a supplemental agreement with respect to a Schedule I program could vary the conditions of the original agreement only as to the manner in which Canada would contribute to the program and the manner in which accounts were submitted. A supplemental agreement for a Schedule II program might require the program to be continued as in the original authority or it might allow a province to substitute a provincial program having substantially similar objectives.

The Established Programs (Interim Arrangements) Act was designed to provide for an interim period during which a province might assume greater administrative and financial responsibility for the enumerated programs and during which time more permanent arrangements governing joint programs might be devised. The length of the interim period was set out in the Act for each program and varied from March 31, 1967 to December 31, 1970. The tax abatement associated with Schedule I programs was also set out in the Act and varied from 1% for the health grant program to 14% for hospital insurance.

Quebec alone availed itself of the provisions of the above legislation. At the federal-provincial meetings in September and October 1966, the federal government offered the provinces revised and more permanent arrangements. The federal government proposed to abate, for the period 1967-70, 17% of the personal income tax in those provinces that would take over the financial responsibility for the hospital insurance, special welfare (i.e., Canada Assistance Plan) and health grant programs. To ensure fiscal equity, equalization and operating cost adjustment payments were to be associated with the abatement. As the technical and vocational program was being discontinued in its existing form, the offer did not apply to that program. These proposals were offered again at the November 4-5, 1968 meeting of the Ministers of Finance and Provincial Treasurers. No province took up the offer. As a consequence, the length of the interim period of the Established Programs (Interim Arrangements) Act for the hospital insurance and special welfare program was extended in 1972 to December 31, 1977 and March 31, 1977, respectively. The interim period for the health grants program was not extended beyond March 31, 1972 as this program was being phased out. Also tax abatement points associated with the hospital insurance program were raised in 1972 to 16 points and with the special welfare program to five points. The increase was occasioned by the reassignment of the one point associated with the defunct health grants program and conversion of the tax points under the pre-1972 Income Tax Act to points of the same approximate value when the latter was revised in 1972.

20.4 Provincial government finance

Provincial government accounting and reporting practices vary considerably so that adjustments to the provincial public accounts figures are required in order to produce comparable statistics. For example, financial data relating to specific functions are sometimes excluded from the ordinary or current accounts of certain provinces; therefore the transactions of special or administrative funds under which these functions are carried out must be consolidated with the provincial accounts to produce statistics comparable to those of the other provinces.

In 1971, Statistics Canada changed its presentation of the financial position of provincial and territorial governments. Data presented here are not comparable with data given in the 1972 *Canada Year Book* as new concepts of provincial indebtedness have been developed. Further information may be obtained from *Provincial government finance, assets, liabilities, and sources and uses of funds* (Catalogue No. 68-209).

Gross general revenue and expenditure for the year ended March 31, 1970 are given in Table 20.17. Liabilities of provincial and territorial governments and liabilities guaranteed by provincial governments replace the previous table on direct and indirect indebtedness and are presented in Tables 20.18 and 20.19. Bonds and debentures outstanding as at March 31, 1969 and 1970 are listed in Table 20.20.

20.5 Local government finance

Local government taxation. In 1969, the latest year for which complete data are available, local government revenue from taxation increased by 11% to \$3,300 million. The rate of collections (excluding Quebec for which data are not available) declined slightly from 99.1% to 98.5% but taxes receivable fell from 11.5% of taxation revenue to 11.2%. Collection rate declines in Newfoundland, Ontario, Saskatchewan and Alberta offset improvements in these rates in the other provinces and territories; conversely, higher percentages of taxes receivable in Nova Scotia, Ontario, Manitoba and Saskatchewan were more than offset by lower rates elsewhere.

Local government revenue, expenditure and debt. As in previous years, gross revenue and expenditure of local governments both increased significantly in 1969, gross revenue by 12.3% and gross expenditure by 10.7% compared with 1968 results. Increases in both categories over the previous year were recorded in all provinces and territories except Newfoundland where 1968 figures were distorted by a large private grant for sewer and water installation. Apart from Newfoundland, revenues and expenditures increased relatively over 1968 less than the national average in Prince Edward Island, New Brunswick, Quebec, Saskatchewan and Alberta. Details of 1969 financial data are given in Tables 20.21 - 20.23.

20.6 Tax rates

Taxes are imposed in Canada by the federal government, by provincial governments and by municipalities. The Government of Canada has the right to raise money "by any mode or system of taxation" while the provincial legislatures are restricted to "direct taxation within the province in order to the raising of a revenue for provincial purposes". Thus, the provinces have a right to use only the field of direct taxation and the federal government is not subject to any constitutional restriction in matters of taxation. Municipalities derive their incorporation with its associated powers, fiscal and otherwise, from the provincial government concerned and are thus also limited to direct taxation.

A direct tax is generally recognized as one "which is demanded from the very person who it is intended or desired should pay it". This concept has limited the provincial governments to the imposition of income tax, retail sales tax, succession duties and an assortment of other direct levies. In turn, municipalities, acting under provincial legislation, tax real estate, water consumption and places of business. The federal government levies taxes on income, excise taxes, excise and customs duties, and a sales tax.

Starting in 1941, a series of federal-provincial tax agreements were concluded to promote the orderly imposition of direct taxes. The duration of each agreement was normally five years. Under the earlier agreements, the participating provinces undertook — in return for compensation — not to use, or permit their municipalities to use, certain of the direct taxes. Under more recent arrangements, the federal personal and corporation income tax otherwise payable in all provinces and the estate tax otherwise payable in three provinces were abated by certain percentages to make room for provincial levies.

Federal tax reform amendments passed in 1971, which became effective for the most part from the beginning of 1972, included a new personal income tax rate structure which was not designed to be abated in the previous way. At the same time the federal estate tax was terminated. As a result, the arrangement under which federal taxes are abated has general application now only for the corporation income tax. All provinces impose taxes on the income of individuals and corporations and all but Alberta impose taxes on property passing at death. As part of the current fiscal arrangements, the federal government has entered into tax collection agreements under which it collects provincial personal income taxes for all provinces except Quebec, provincial corporation income taxes for all provinces except Ontario and Quebec, and provincial succession duties for all provinces except Quebec, Ontario and British Columbia.

20.6.1 Federal taxes

Individual income tax. Personal income taxation in Canada is imposed on the basis of residence. Every individual who is resident in Canada at any time during a year is liable for the payment of income tax on all his income. A non-resident is liable for tax only on income from sources in Canada. The term "residence", generally speaking, is the place where a person resides or where he maintains a dwelling ready at all times for his use. There are also statutory extensions of the meaning of "resident" to include a person who has sojourned in Canada for an aggregate period of 183 days in a taxation year, or a person who was during the year a member of the Armed Forces of Canada, or an officer or servant of Canada or of any one of its provinces, or the spouse or dependent child of any such person. The extended meaning of resident also includes employees who go from Canada to work under certain international development assistance programs.

The Canadian tax law uses the concepts "income" and "taxable income". The income of a resident of Canada for a taxation year comprises his revenues from all sources inside or outside Canada and includes income for the year from businesses, property, offices, and employments. Since January 1, 1972, it also includes one half of taxable capital gains.

In computing his income, an individual must include benefits from employment, fees, commissions, dividends, annuities, pension benefits, interest, alimony and maintenance payments. Also included are unemployment insurance benefits, scholarships in excess of \$500, benefits under a disability insurance plan to which his employer contributes and other miscellaneous items of income. On the other hand, war service disability pensions paid by Canada or a country that was an ally at the time of the war service, social assistance payments made on a needs-test basis under a prescribed program, compensation in respect of an injury or death paid under a Workmen's Compensation Act of a province and family income security payments do not have to be included in the computation of income.

An employee does not have to include in his income allowances paid to him by his employer to cover travelling expenses to a distant work site, or board and lodging while at the site. In order to qualify, the worker must travel away from his ordinary residence in which he supports his wife or other dependant, the work site must be temporary and the time away from his ordinary residence must be at least 36 hours.

Certain amounts are deductible in computing income. These include contributions to a registered employees' pension plan, premiums to a registered retirement savings plan, premiums under the unemployment insurance program, alimony payments and union dues. An employee may deduct 3% of his salary or wages (up to a maximum of \$150 per year) to cover expenses of earning his income. No receipts or details of actual expenditures are necessary to claim this deduction. Expenses of meals and lodging while away from home are deductible by employees who have to travel as they perform their work, such as employees who work on trains or who drive trucks. Where a mother has her children cared for in order that she may work, she may deduct this expense subject to certain limitations. A father may deduct child care expenses where he is the only parent of the family or where the mother is incapable of caring for the children. Expenses of moving to a new work location are deductible from income earned in the new location. These moving expenses may be deducted by salary or wage earners, self-employed persons and, in some instances, by students at post-secondary educational institutions. Students attending universities, colleges, high schools or certain other certified educational institutions in Canada may deduct their tuition fees if they exceed \$25 per annum. Students in full-time attendance at universities outside Canada are also allowed to deduct their tuition fees.

An individual who is carrying on a business may deduct his business expenses in computing his income. These include wages, rents, depreciation (called capital cost allowances), municipal taxes, interest on borrowed money, reserves for doubtful debts, contributions to pension plans or profit-sharing plans for his employees, and bad debts.

All individuals now have to count half of their capital gains as income. They may deduct half of their capital losses against these gains. In the event that half of an individual's losses exceed the amount included in income in respect of capital gains, \$1,000 of these losses may be deducted from other income. Losses not deducted in the year incurred may be carried back one year or forward to future years to be deducted. Capital gains or losses are those realized on the disposition of property. Other gains or losses such as from a lottery or gambling are not

included. The sale of personal property at a price not exceeding \$1,000, and the sale of a taxpayer's home, do not create a capital gain or loss. A sale or disposition of property is deemed to have taken place when the taxpayer dies or makes a gift of property unless the property is left or given to his spouse. The amount of a capital gain or loss on disposition of property is determined by reference to its adjusted cost basis. Capital gains on property owned at the beginning of the system are computed by reference to the higher of cost or valuation-day value and capital losses by reference to the lower of cost or valuation-day value. When property is acquired after valuation day, actual cost plus or minus adjustments after that date will give the adjusted cost basis. Valuation day for purposes of shares that are publicly traded on Canadian stock exchanges was December 22, 1971 and the valuation day for all other property, such as bonds, rental property, cottages or shares in a private company was December 31, 1971. Special rules apply for individuals who become, or cease to be, residents of Canada. Gains arising out of the conduct of a business continue to be fully taxable.

Having computed his income, the individual then calculates his taxable income by deducting certain exemptions and deductions. These are: for single status, \$1,500; for married status, \$2,850; for dependent children under age 16, \$300 per child; for other dependants (as defined in the law), including dependent children over age 15 and under 21 or over 20 and attending school, \$550 per dependant; where the taxpayer is 65 years of age or over, an additional \$650; where the taxpayer is blind or confined for the whole of the taxation year to a bed or a wheelchair, an additional \$650; charitable donations, up to 20% of income; and medical expenses, the amount in excess of 3% of income. In lieu of claiming deductions for charitable donations and medical expenses an individual may claim a standard deduction of \$100.

The extra deduction for married status is reduced where the taxpayer's spouse has income in excess of \$250. The deduction of \$300 for supporting a child is reduced where the child has income in excess of \$1,000 and the deduction of \$550 is reduced where the dependant has income in excess of \$1,050. The amount of the guaranteed income supplement, which is a payment made to individuals who have little or no income in addition to their old age pension, is deductible in computing taxable income. Individuals who have incurred business losses in other years may deduct these in computing taxable income.

As already stated, an individual who is resident in Canada is taxed on his income from both inside and outside Canada. An individual who is not resident in Canada at any time during the year but who carries on business in Canada or who earns salary or wages in Canada is taxed on the income earned in Canada. In computing taxable income earned in Canada, such a non-resident individual is allowed to deduct that part of the exemptions and deductions that may reasonably be attributed to the income earned in Canada. An individual who ceases to be a resident of Canada during the year or who becomes a resident during the year so that he is resident for only part of the year is subject to income tax as a resident of Canada on only that part of his income for the year received while he is resident in Canada. In these circumstances, the deductions from income permitted in determining taxable income are the amounts which may reasonably be considered as applicable to the period during which he is resident in Canada.

A non-resident who disposes of taxable Canadian property (shares of Canadian public corporations are excluded unless ownership exceeds 25%) is liable for tax on one half of any capital gain. Capital gains or losses from the disposal of taxable Canadian property are combined with the non-resident's Canadian employment or business income. This taxation of capital gains is subject to restrictions in a number of tax treaties between Canada and other countries.

Two provisions were enacted in 1971 to provide for averaging income over a period of years where income for a year is unusually high. The first of these is an averaging calculation that will be made by the Department of National Revenue where an individual's income for the year is 20% more than the average of his incomes for the preceding four years and 10% more than his income for the immediately preceding year. This calculation, which will be made without application by the taxpayer, will reduce the effects of the progressive schedule of rates upon an unusual increase in income in the year. The calculation will first be made for 1973, using 1972 as the base. It will not be possible to use four preceding years in the base until 1976. The second averaging device, which first becomes effective for 1972, is by the purchase of a special type of annuity contract called an income-averaging annuity. The cost of this annuity

contract is deductible from income in the year it is purchased and the annuity payments are included in income when received. Only certain kinds of income may be used to purchase an income-averaging annuity. These include capital gains, a lump sum from a pension plan, proceeds from a literary or artistic work or amounts received from activities as an athlete, musician or public entertainer.

The amount of tax is determined by applying a progressive schedule of rates to taxable income. This schedule of rates starts at 17% on the first \$500 of taxable income and increases to 47% on taxable income in excess of \$60,000. For 1972, tax otherwise payable was reduced by 3%. In addition, the Income Tax Act provides that the rate of tax on the first \$500 of taxable income, which is 17% in 1972, will be reduced each year until it becomes 6% in 1976.

Individuals who reside in the Yukon Territory or the Northwest Territories or who reside outside Canada but are deemed to be residents in Canada for tax purposes (such as diplomats and others posted outside the country) must pay an additional tax of 30% of their tax otherwise payable. This tax is intended to correspond in an approximate way to the income tax imposed by the provinces on their residents.

An individual who receives a taxable dividend from a Canadian corporation is allowed to deduct an amount called a dividend tax credit from his tax otherwise payable. This is in recognition of the fact that the earnings from which the dividend is paid have borne corporation income tax. It also provides encouragement for Canadians to participate in ownership of Canadian corporations. The individual increases the amount of the dividends he has received by one third and includes this additional one third in his income. He then deducts from his tax an amount equal to four fifths of the additional one third that was included in his income.

An individual who receives income from foreign sources may deduct from his tax the amount of tax he has paid to a foreign government on his foreign source income. This deduction may not exceed the Canadian tax related to such income.

An individual who earns income in Quebec may deduct 24% of his tax attributable to such income. This abatement of tax is in recognition of the fact that Quebec entirely finances certain programs which are partly financed by the federal government in other provinces.

To a very large extent, individual income tax is payable as the income is earned. Taxpayers in receipt of salary or wages have tax deducted from their pay by their employer and in this way pay nearly 100% of their tax liability during the calendar year. The balance of the tax, if any, is payable at the time of filing the tax return on or before April 30 in the following year. Individuals with more than 25% of their income in a form not subject to tax deductions at the source must pay tax by quarterly instalments throughout the year. Returns of these individuals must be filed on or before April 30 in the following calendar year. Farmers and fishermen pay two thirds of their tax on or before December 31 each year and the remainder on or before April 30 in the following year. Table 20.24 shows the amount of personal income tax payable on various levels of income in 1972.

Corporation income tax. The Income Tax Act levies a tax upon the income from anywhere in the world of corporations resident in Canada and upon the income attributable to operations in Canada of non-resident corporations carrying on business in Canada. One half of capital gains must be included in income. In computing their income, corporations may deduct operating expenses including municipal real estate taxes, reserves for doubtful debts, bad debts and interest on borrowed money. The deduction for interest includes interest on money borrowed to acquire shares in another corporation. There is a limitation on the deduction of interest paid to non-residents. One half of capital losses may be deducted from the capital gains included in income.

Corporations may deduct over a period of years the capital cost of all depreciable property. The yearly deductions of normal capital cost allowances are computed on the diminishing balance principle. Regulations issued under authority of the Income Tax Act established a number of classes of property and maximum rates. Typical rates include 5% and 10% for buildings, 20% for machinery and 30% for automobiles. Where property is disposed of for more than the amount to which it has been written down by capital cost allowances, the excess allowances are "recaptured" through an addition to income or by an adjustment to the undepreciated balance for the class of property.

Accelerated depreciation (full write-off in two years) is allowed in respect of structures

and equipment acquired in the period April 27, 1965 to December 31, 1973 to prevent water pollution, and in the period March 13, 1970 to December 31, 1973 to prevent air pollution.

A corporate taxpayer who does not elect to receive a grant under the Training-on-the-Job Program may deduct 60% of approved wage costs incurred in the period after October 1971 and before April 1974. This deduction is in addition to the normal deduction for wages. Expenditures on scientific research related to the business of the taxpayer may be written off for tax purposes in the year when incurred.

A corporation whose principal business is mining, oil production and allied activities may deduct the costs of exploration and development in Canada against any income in the year the costs were incurred or in subsequent years. Taxpayers who do not meet the "principal business" test are entitled to deduct exploration and development expenses from mining and petroleum income. Starting in 1972, these expenses will be deductible from other income over a period of time if they exceed mining and petroleum income. Taxpayers may deduct certain foreign drilling expenses from directly related foreign-source income. Starting in 1972, all taxpayers may put foreign exploration and development expenses in a separate asset class and deduct them over a period of time if they exceed income from foreign mineral and petroleum properties.

The profits derived during the first three years of operation of a new mine are exempt from income tax until December 31, 1973. In place of the three-year tax exemption there will be an immediate write-off of capital equipment and facilities for a new mine to the extent of income from the mine. The assets eligible for this accelerated depreciation include buildings, mining machinery, processing facilities and "social capital" such as access roads, sewage plants, housing, schools, airports and docks. The accelerated write-off provision for new mines will also apply in the case of a major expansion of an existing mine where there has been at least a 25% increase in milling capacity. The list of eligible assets is the same as for new mines except that "social capital" does not qualify.

Taxpayers operating mines, oil wells, gas wells and wells for extracting potash by the solution method have been allowed a depletion allowance, usually computed as a percentage of profits (after deduction of capital cost allowances, exploration and drilling expenses and certain interest expenses) derived from mineral, oil or gas production. This allowance is in addition to capital cost allowances on buildings, machinery and similar depreciable assets used by the taxpayer and the deduction of his exploration and drilling expenses. This will continue until the end of 1976 after which a taxpayer will be able to deduct depletion only if it has been "earned" by exploration. For every \$3 of eligible expenditures, a taxpayer will earn the right to deduct \$1 of depletion. Eligible expenditures made after November 7, 1969 can be accumulated for the purpose of calculating earned depletion for 1977 and subsequent years.

Taxpayers operating timber limits receive an annual cost allowance which is a rateable proportion of the amount invested in the limit and is based on the amount of timber cut in the year.

In computing taxable income, corporations, with certain exceptions, may deduct dividends received from other Canadian taxable corporations and also from certain non-resident affiliates. Business losses may be carried back one year or forward five years and deducted in computing taxable income. Corporations may also deduct donations to charitable organizations up to a maximum of 20% of their income.

The general rates of tax payable by corporations on their taxable income are as follows: 1972, 50%; 1973, 49%; 1974, 48%; 1975, 47%; 1976 and subsequent years, 46%. These rates of tax are reduced by ten percentage points on income earned in a province. This "provincial abatement" is provided to make room for provincial income taxes. At the present time, provincial rates of corporate income tax range from 10% to 13%. For profits earned in the period July 1, 1971 to December 31, 1972, there is a temporary tax reduction equal to 7% of the tax otherwise payable before the ten percentage points provincial abatement.

A "small business deduction" reduces the rate of tax on certain business income to 25%. This concession is restricted to Canadian corporations which are not controlled by a non-resident corporation or by a Canadian public corporation. It applies only to income from an active business carried on in Canada and not to investment income. The maximum amount of taxable income on which the deduction may be calculated is \$50,000 in any one year. A corporation is entitled to this deduction only until it has accumulated \$400,000 of taxable income commencing with taxation years starting after 1971. The payment of taxable dividends

reduces the accumulation of taxable income for purposes of this limitation. The rate of 25% referred to will not be affected by the gradual reduction in the general federal rate of corporation income tax between 1972 and 1976 but this 25% rate is reduced by the ten percentage points provincial abatement.

A corporation that qualifies as an "investment corporation" pays tax at a rate of only 25%. This rate is also reduced by the provincial abatement.

The investment income (other than dividends) of a private corporation is subject to the general rate of tax (i.e., 50% in 1972 becoming 46% in 1976 less the provincial abatement) but an amount not exceeding 25% of this income is refunded when dividends are paid to shareholders.

Dividends received by a private corporation from a Canadian corporation controlled by it are deductible in computing its taxable income (except where paid out of designated surplus or under conditions that entitle the paying corporation to a refund). Dividends received by a private corporation from portfolio investments are subject to a special 33½% tax but this is refunded when dividends are paid to shareholders.

A corporation may elect to pay a special 15% tax on its 1971 undistributed income on hand. Dividends received from this tax-paid undistributed income are not included in the income of the receiving shareholder but the amount of the dividend will reduce the adjusted cost basis of the shares for capital gains tax purposes. Dividends paid from the untaxed half of a corporation's capital gains are also excluded from the income of the recipient shareholders but with no similar reduction in the adjusted cost base of the shares for capital gains tax purposes.

Special rules are provided for the taxation of special-purpose companies such as mutual fund corporations, life insurance companies, non-resident-owned investment companies and co-operatives.

In addition to the reduction equal to 10% of taxable income earned in a province, a corporation may reduce its tax by a credit for taxes paid to foreign governments on foreign source income. This credit may not exceed the Canadian tax related to such income. A corporation may also deduct from its tax an amount equal to two thirds of a provincial tax on income from logging operations not exceeding 6⅓% of its income from logging operations in the province. (At present only Ontario, Quebec and British Columbia impose logging taxes.) Commencing in 1977, a mining corporation will be able to claim an extra federal tax abatement of 15% of its production profits in a province.

Corporations are required to pay their tax by monthly instalments throughout their taxation year. Any balance of tax remaining has to be paid by the last day of the third month following the close of the taxation year, and the return for the year must be filed by the last day of the sixth month following the close of the taxation year.

Taxation of non-residents. An individual or corporation not resident in Canada is liable for Canadian income tax on income from employment or from carrying on business in Canada and on one half of capital gains less losses on disposals of "taxable Canadian property". For this purpose taxable Canadian property includes: real property interests situated in Canada; assets used in carrying on business in Canada; interests in certain partnerships and trusts; shares in a corporation resident in Canada other than a public corporation; and shares in Canadian public corporations where the non-resident owns a 25% or greater interest. The taxation of capital gains may be restricted by the provisions in tax treaties between Canada and other countries.

The expression "carrying on business in Canada" includes producing, growing, packaging or improving any article in Canada and also soliciting orders or offering anything for sale in Canada through an agent or servant. However, this is usually modified by tax treaties so that an enterprise of the other country is taxed by Canada on its industrial and commercial profits only if it carries on business through a permanent establishment in this country. Tax treaties also provide some exemptions from tax on remuneration for services.

The taxable income of non-resident individuals derived from employment or carrying on business or from capital gains in Canada is taxed under the same schedule of rates as Canadian resident individuals.

Income earned by non-resident corporations carrying on business or from capital gains in Canada is taxed at the regular rates of corporation income tax. The distributable business

earnings of a branch of a non-resident corporation are also subject to an additional tax often referred to as a branch tax. This tax applies to the branch earnings net of taxes that are not reinvested in the business in Canada. The branch tax, which is imposed at the same rate as the non-resident withholding tax on dividends referred to below, is designed to place non-resident corporations that carry on business through a branch in Canada in a comparable position to those non-residents that conduct their Canadian operations through a separate company incorporated in Canada.

Certain specific items of income paid to non-residents from sources in Canada are subject to tax withheld at the source by the Canadian payer. This non-resident withholding tax applies to interest (except interest on certain bonds and interest paid to certain exempt lenders), dividends, rents, royalties, management fees, income from a trust or estate, alimony, pension benefits (other than the old age security pension and up to \$1,290 of Canada Pension Plan or Quebec Pension Plan benefits), proceeds from deferred income plans and the taxable portion of annuities. The rate of this tax is generally 15% but the rate on royalties from motion picture and television films is only 10% and the standard rate of 15% on dividends is reduced to 10% in the case of dividends paid by a corporation that has a degree of Canadian ownership. Generally, a corporation is regarded as having a degree of Canadian ownership where 25% of its equity and voting shares are owned by Canadians and/or corporations controlled in Canada, or where the voting shares of the corporation are listed on a Canadian stock exchange and no more than 75% of its issued outstanding voting shares are owned by a non-resident alone or in combination with related persons.

The Income Tax Act provides that the rate of the above-mentioned non-resident withholding tax will become 25% in 1976, except for the rate on dividends paid by a corporation with a degree of Canadian ownership which will be 20%. These rates may be modified by tax treaties.

Non-residents who receive from sources in Canada only the kinds of income subject to the non-resident withholding tax do not file returns to Canada. However, those who receive rents on real property, timber royalties, pension benefits or proceeds from deferred income plans may elect to file returns and be taxed at personal or corporation rates as the case may be.

Estate and gift taxes. The federal government formerly imposed an estate tax and a tax on gifts. These taxes do not apply in the case of a death occurring after 1971 or to a gift made after 1971.

Excise taxes. The Excise Tax Act levies a general sales tax and special excise taxes. These taxes are levied on goods imported into Canada as well as on goods produced in Canada. They are not levied on goods exported.

The general sales tax is at the rate of 12%. It is levied on the manufacturer's sale price of goods produced or manufactured in Canada or on the duty-paid value of goods imported into Canada. "Duty-paid value" includes the amount of customs duties, if any. For alcoholic beverages and tobacco products the sale price for purposes of the sales tax includes excise duties levied under the Excise Act. The rate of sales tax on a long list of building materials is 11% instead of 12%.

Some goods are exempt from sales tax. Drugs, electricity, fuels for lighting or heating and most foodstuffs are exempt, and also articles and materials purchased by public hospitals and certain welfare institutions. The products of farms, forests, mines and fisheries are, to a large extent, exempt as well as most equipment used in farming and fishing. Machinery and equipment used directly in production and materials consumed or expended in production are also exempt, and also equipment acquired by manufacturers or producers to prevent or reduce pollution to water, soil or air from their manufacturing operations. A number of items are exempt when purchased by municipalities. These and other exemptions are set forth in the schedules to the Excise Tax Act.

The Excise Tax Act also imposes a number of special excise taxes which are in addition to the sales tax. Where these are ad valorem taxes they are levied on the same price or duty-paid value as the general sales tax. The special excise taxes levied at present are given in Table 20.25.

Excise duties. The Excise Act levies taxes (referred to as excise duties) upon alcohol, alcoholic beverages (other than wines) and tobacco products. These duties are not levied on imports but the customs tariff applies special duties to these products equivalent to the excise duties levied on the products manufactured in Canada. Exported goods are not subject to excise duties.

The duties on spirits are on a proof gallon basis. They do not apply to denatured alcohol intended for use in the arts and industries, or for fuel, light or power, or any mechanical purposes. The various duties are as follows: on every gallon of the strength of proof distilled in Canada, \$14.25; on every gallon of the strength of proof used in manufacture of: medicines, extracts, pharmaceutical preparations, etc., \$1.50 per gallon; approved chemical compositions, 15 cents per gallon; spirits sold to a druggist and used in the preparation of prescriptions, \$1.50 per gallon; imported spirits when taken into a bonded manufactory in addition to other duties, 30 cents per gallon.

Canadian brandy (a spirit distilled exclusively from juices of native fruits without the addition of sweetening materials) is subject to an excise duty of \$12.25 per proof gallon. All beer or other malt liquor is subject to a duty of 42 cents per gallon.

Excise duties are imposed on tobacco, cigars and cigarettes in addition to the special excise taxes which have already been described. The rates of excise duty are as follows: on manufactured tobacco of all descriptions, except cigarettes, 35 cents per lb.; cigarettes weighing not more than three lb. per thousand (nearly all of the cigarettes used in Canada are of this type), \$4 per thousand; cigarettes weighing more than three lb. per thousand, \$5 per thousand; cigars, \$2 per thousand; Canadian raw leaf tobacco when sold for consumption, 10 cents per lb.

Total taxes on tobacco products. The aggregate of taxes imposed on tobacco products under the Excise Tax Act and the duties imposed under the Excise Act are: cigarettes, \$10 per thousand (20 cents per pack of 20 cigarettes) plus the 12% sales tax on the manufacturer's sale price; pipe and cut tobacco, \$1.25 per lb. plus the 12% sales tax on the manufacturer's sale price; cigars, \$2 per thousand plus the 17½% special excise tax and the 12% sales tax on the manufacturer's sale price.

Customs duties. Most goods imported into Canada are subject to customs duties at various rates as provided by tariff schedules. Customs duties which once were the chief source of revenue for the country have declined in importance as a source of revenue to the point where they now provide less than 10% of the total. Quite apart from its revenue aspects, however, the tariff still occupies an important place as an instrument of economic policy.

The Canadian Tariff consists mainly of three sets of rates, namely, British Preferential, Most-Favoured-Nation and General. The British Preferential rates are, with some exceptions, the lowest rates. They are applied to imported dutiable commodities shipped directly to Canada from countries within the British Commonwealth. Special rates lower than the ordinary preferential duty are applied on certain goods imported from designated Commonwealth countries.

The Most-Favoured-Nation rates apply to goods from countries that have been accorded tariff treatment more favourable than the General Tariff but which are not entitled to the British Preferential rate. Canada has Most-Favoured-Nation arrangements with almost every country outside the Commonwealth. The most important agreement providing for the exchange of Most-Favoured-Nation treatment is the General Agreement on Tariffs and Trade.

The General Tariff applies to imports from countries not entitled to either the British Preferential or Most-Favoured-Nation treatment. Few countries are in this category and in terms of trade coverage are negligible.

In all cases where the tariff applies there are provisions for drawbacks of duty on imports of materials used in the manufacture of products later exported. The purpose of these drawbacks is to assist Canadian manufacturers to compete with foreign manufacturers of similar goods. There is a second class of drawbacks known as "home consumption" drawbacks. These apply to imported materials used in the production of specified classes of goods manufactured for home consumption.

The tariff schedules are too lengthy and complicated to be summarized here but the rates which apply on any particular item may be obtained from the Department of National Revenue which is responsible for administering the Customs Tariff.

20.6.2 Provincial taxes

All of Canada's ten provinces impose a wide variety of taxes to raise the revenue necessary for provincial purposes. All provinces levy a tax on the income of individuals and corporations resident within their boundaries or deriving income from activities or operations carried out

therein. Only Ontario and Quebec impose special taxes on corporations in addition to income tax. All provinces except Alberta impose a tax on property passing at death, referred to as succession duties; these provinces also impose a tax on gifts. Under the terms of the existing federal-provincial fiscal arrangements, the federal government makes equalization payments to some provinces in recognition of the fact that the potential tax yield in those provinces, measured on a per capita basis, is lower than the national per capita tax yield. For some provinces, the equalization payments constitute a very important source of revenue.

Individual income tax. All provinces levy a tax on the income of individuals who reside within their boundaries or who earn business income therein. An individual who is resident in a particular province on the last day of the year, and has no income for the year from a business with a permanent establishment outside the province, is taxable by the province on his world income for the year. Income earned from employment in a province by a non-resident of Canada is taxable by the province. Income earned by an individual not resident in a particular province from carrying on a business through a permanent establishment in that province is taxable by that province.

In nine of the ten provinces, the provincial taxes are computed as a percentage of federal tax, "Federal tax", on which the provinces impose their tax, is after the dividend tax credit but before any foreign tax credit or the special 3% reduction for 1972. In Quebec, provincial income tax is levied at graduated rates that progress from 10% on the first \$2,000 of taxable income to a maximum of 28% on the excess over \$60,000. The determination of taxable income for Quebec tax is based on exemptions and deductions which, with the exception of deductions for dependent children under age 16, are similar to those for federal tax. Quebec taxpayers who have married status for tax purposes do not pay the provincial tax unless their net income exceeds \$4,000; all other Quebec taxpayers do not pay the tax unless their net income exceeds \$2,000.

Provincial income tax liability represents the following percentage of federal tax for 1972: Newfoundland, 36%; Prince Edward Island, 36%; Nova Scotia, 38.5%; New Brunswick, 41.5%; Ontario, 29.585%; Manitoba, 42.5%; Saskatchewan, 40%; Alberta, 36%; British Columbia, 30.5%. Quebec's liability is not directly related to federal tax but is approximately 58%. However, since Quebec taxpayers receive a deduction of 24% of federal tax from the federal government, Quebec provincial income tax represents 34% of the federal tax.

All provinces except Quebec have signed agreements for the collection of their individual income tax by the federal government. Both Ontario and Manitoba have introduced property tax credit schemes which are administered through the tax collection machinery of the Department of National Revenue. These plans are designed to integrate the income and property taxes.

Corporate income tax. All provinces levy a tax on the taxable income of corporations derived from activities carried out within their boundaries. In all provinces except Ontario and Quebec, the provincial tax imposed on taxable income in the province is determined on the same basis as for federal income tax. In Ontario and Quebec, the determination of taxable income for purposes of provincial tax follows closely the federal rules. Six of the ten provinces levy corporate income taxes at rates in excess of the 10% abatement allowed by the federal government. The rate that applies in Alberta is 11%, in Saskatchewan, Ontario and Quebec, 12%, and in Newfoundland and Manitoba, 13%. All provinces except Ontario and Quebec have signed agreements for the collection of the corporate income taxes by the federal government.

Taxes on alcoholic beverages and tobacco. Generally, spirits are sold in all provinces through provincial agencies operating as boards or commissions which exercise monopolistic control over alcoholic beverages. The provincial mark-up over the manufacturer's price (usually on top of the government established price) is the effective means of taxation. Beer and wine may be sold by retailers or government stores, depending on the province, but in all cases these sales contribute to provincial revenues. With the exception of Ontario and Manitoba, and some variations in the taxing of beer, each province with a retail sales tax generally imposes the basic rate of tax on all sales of beer, wine and spirits. Ontario taxes retail sales of alcoholic beverages at a special 10% rate, and Manitoba taxes retail sales of wine, spirits and imported beer at 10%, with beer manufactured in Canada remaining taxable at the 5% basic rate. On table wines retailing under \$3, the Manitoba Liquor Control Commission maintains a reduced mark-up to

offset the increase of sales tax from the 5% to the 10% rate. Prince Edward Island imposes a tax of 10% on all beer, wine and spirits sold at retail, collected under authority of the Health Tax Act.

All provinces impose special retail taxes on the sale of tobacco products. The rates of tax per cigarette are as follows: Newfoundland, 1 cent; Prince Edward Island, Nova Scotia, New Brunswick, Quebec and Manitoba, 3/5ths cent; Ontario, 23/50ths cent; and Saskatchewan, Alberta and British Columbia, 8/25ths cent. In addition, the provinces impose special taxes on cigars and cut tobacco.

Retail sales taxes. Retail sales taxes are levied on the final purchaser or user and are collected by the retailer. All provinces except Alberta levy this type of tax at rates as follows: Newfoundland and Nova Scotia, 7%; Prince Edward Island, New Brunswick and Quebec, 8%; and Manitoba, Saskatchewan and British Columbia, 5%. Ontario has a dual rate structure. A rate of 5% is charged on most taxable items; 10% is charged on amusement, meals over \$2.50 and beer and spirits. These direct levies apply to tangible taxable commodities sold, with varying exemptions, for consumption in the province and to a few selected services, for example: to telephone services in all provinces; in Quebec, to telecommunications, meals and hotel and motel charges; in Prince Edward Island, to laundry and dry cleaning services, to accommodations, and to repair and installations labour; in New Brunswick, to telecommunications, to meals and hotel and motel charges and to laundry and dry cleaning charges; and in Manitoba, to a broad range of services including dry cleaning, furniture repairs, motel accommodation, etc. The sales taxes do not apply to goods sold for delivery in other provinces or to exported commodities. All provinces imposing sales taxes provide comprehensive exemptions for foodstuffs and drugs; in Quebec and New Brunswick, pharmaceutical products are exempt only when sold on prescription. In British Columbia, a 5% levy on accommodations is made under the Hotel and Motel Room Tax Act.

Amusement taxes. Each of the provinces with the exception of Newfoundland, Alberta, Saskatchewan and British Columbia has a tax on admission to places of entertainment. In Quebec, this tax is payable on race course admissions only. In addition, there is generally a licence fee imposed on the operator or owner of these amusement places. The tax on admissions is within the range of 5% to 15%.

Gasoline and diesel fuel oil taxes. Each of the ten provinces imposes a tax on the purchase of gasoline by motorists and truckers. The rates vary from 15 cents per gallon in Alberta and British Columbia to 21 cents in Prince Edward Island and 25 cents in Newfoundland. The amount of tax borne by one gallon of gasoline and diesel fuel, respectively, in each province is: Newfoundland 25 cents, 25 cents; Prince Edward Island 21 cents, 25 cents; Nova Scotia 21 cents, 27 cents; New Brunswick 20 cents, 23 cents; Quebec 19 cents, 25 cents; Ontario 19 cents, 25 cents; Manitoba 17 cents, 20 cents; Saskatchewan 19 cents, 21 cents; Alberta 15 cents, 17 cents; British Columbia 15 cents, 17 cents.

Certain qualifications apply to the above taxes. In Prince Edward Island, gasoline and diesel fuel used by primary producers — farmers, fishermen, manufacturers and processors — are exempt from tax as are also gasoline and motor fuel used by owners or operators of ski-tows, and that used by consumers engaged in the construction of the Northumberland Strait Crossing. In Quebec and Ontario, some relief from taxation is given where gasoline or fuel oil is used for farming, manufacturing, commercial fishing and in stationary engines. In Manitoba, exemptions or refunds are allowed on fuel used in operating agricultural machinery, farm trucks and municipal fire apparatus, and in trapping, fishing and prospecting; diesel fuel for off-highway use is taxable at 20 cents per gallon at the time of purchase but a refund of 15 cents per gallon is subsequently allowed to the purchaser. In Saskatchewan, gasoline and diesel fuel used by farmers in farm machinery and trucks are exempt from tax. In Alberta, tax on fuel for domestic heating is three cents less than shown; gasoline and diesel fuel used in aircraft, motor boats, snowmobiles and off-highway internal combustion engines are taxed at three cents per gallon and exemption is allowed for other uses, including farm trucks and machinery. In British Columbia the net tax rate (after refund) on gasoline used in logging trucks off highway, in certain power units of motor vehicles for stationary industrial use and in vehicles used by certain handicapped persons, on motor fuels coloured purple for certain off-highway use (including marine) and on aviation fuels is three cents per gallon; on motor fuels coloured purple used by bona fide farmers and commercial

fishermen the rate is one cent per gallon; and fuel oil for heating purposes is one half cent per gallon.

Motor vehicle licences and fees. Each province levies a fee on the annual registration of motor vehicles, which is compulsory. Upon registration, a vehicle is issued with licence plates. The rates of fee vary from province to province and, in the case of passenger cars, may be assessed on the weight of the vehicle, the wheel base, the year of manufacture, the number of cylinders of the engine, or at a flat rate. The fees for commercial motor vehicles and trailers are based on the gross weight for which the vehicle is registered, i.e., the weight of the vehicle empty plus the load it is permitted to carry. Every operator or driver of a motor vehicle is required to register periodically and pay a fee for a new driver's licence. The licences are valid for periods of from one to five years and the fees vary from \$1 to \$7 a year.

Taxes on mining operations. All provinces except Prince Edward Island levy taxes of various kinds on mining operations. All provinces impose a tax on the income of firms engaged in mining operations in general or in specific kinds of mining operations. British Columbia, Alberta, Saskatchewan and Manitoba (gas, oil and potash only) impose a tax on the assessed value of minerals or a flat rate per acre of mining property. Quebec levies a tax on the economic value of ore at the pithead in excess of \$50,000, ranging between 9% and 15%, depending on volume. Ontario imposes a tax on the profit on the assessed value of minerals and a flat rate per acre of mining property. Manitoba imposes a flat rate of 15% if mining income exceeds \$50,000; if income is \$50,000 or less, the tax rate is 6%. The British Columbia mining tax rate is 15% on net income from mining in excess of \$10,000.

Tax on logging operations. Quebec, Ontario and British Columbia levy a tax on the income from logging operations of individuals, partnerships, associations or corporations engaged in this activity. In Quebec and Ontario the rate is 10% and in British Columbia 15% on net income where in excess of \$10,000 (in Quebec and British Columbia if the net income is greater than \$10,000 the whole amount is taxable with no basic exemption). In Ontario and Quebec one third and in British Columbia 20% of the tax is allowed as a deduction from provincial corporate income tax or, in Quebec, from the provincial income tax; two thirds of the provincial tax is deductible from federal income tax.

Business taxes. Quebec imposes a tax of one fifth of 1% on paid-up capital of corporations and Ontario levies a similar tax at the rate of one tenth of 1%. Quebec has a place-of-business tax, which is generally \$50 but is reduced to \$25 when the paid-up capital is less than \$25,000; in the case of loan companies, the tax is \$100 when fixed capital exceeds \$100,000. Both Ontario and Quebec levy special taxes on certain kinds of companies such as banks, railway companies, express companies, trust companies and sleeping-car, parlour-car and dining-car companies. In Ontario, these special taxes and the paid-up capital tax are payable over and above the corporation income tax.

Prince Edward Island charges special annual licence fees to most insurance companies, banks, acceptance companies, chain theatres and chain stores, steamship companies, telephone, telegraph and electric light companies and brokers, as well as nominal licence fees to other incorporated companies, the latter being similar to filing fees in other provinces.

Land transfer taxes. Ontario levies a tax based on the price at which ownership of land is transferred; three tenths of 1% is imposed on the purchase price up to \$35,000 and six tenths of 1% on anything in excess of that amount. In Alberta, a registration fee is charged proportional to the registered value of the land; \$5 for the first \$1,000 and \$1 for each additional \$1,000 up to \$25,000 and 50 cents per \$1,000 in excess of that amount; in addition, there is an Assurance Fund fee charged on transfers of mortgages on the difference between the old registered price and the new registered price at the rate of \$2 per \$1,000 up to \$5,000 and \$1 for each additional \$1,000. British Columbia and Saskatchewan do not have a land transfer tax but have an equivalent in land title fees which are based on land values.

Tax on security transfers. Ontario levies a tax on the sale price of securities transferred; the rates are: shares sold, transferred or assigned valued at — under \$1, 1/10th of 1% of value; \$1 to \$5, 1/4 cent per share; \$5 to \$25, 1 cent per share; \$25 to \$50, 2 cents per share; \$50 to \$75, 3 cents per share; \$75 to \$150, 4 cents per share; over \$150, 4 cents per share plus 1/10th of 1% of value in excess of \$150; bonds and debentures, 3 cents for every \$100 or fraction thereof of par value.

Tax on premium income of insurance companies. All ten provinces impose a tax of 2% on the premium income of insurance companies relative to risks incurred in the province; in Alberta, this tax is imposed on the direct written business after deducting dividends and refunds. Saskatchewan imposes a tax of 1% on the motor vehicle premium income of insurance companies to finance a comprehensive high school driver-training program.

Succession duties and gift taxes. All the provinces except Alberta levy succession duties. These duties are a tax upon a succession to property of a deceased person by his beneficiary. Ontario, Quebec and British Columbia collect their own succession duties. The four Atlantic Provinces and Manitoba and Saskatchewan reimposed succession duties with effect from January 1, 1972; however, Prince Edward Island repealed this legislation effective January 1, 1973. The duties are collected by the federal government as agent under three-year collection agreements.

All the provinces except Alberta levy a gift tax. This is a tax on the total value of gifts made in the year by a living person resident in the province. It is intended primarily to protect the revenue from succession duties. For all provinces, except Quebec and Alberta, the tax will be collected by the federal government as agent under collection agreements. Quebec administers its own gift tax.

Provincial property taxes. In unorganized (non-municipal) areas, British Columbia levies property taxes at varying rates according to class for provincial revenue. Improved, forest and tree-farm lands are taxed at 1% of assessed value; farm land at one half of 1%; wild land at 3%; coal land at 2% (non-operating) or 7% (operating); and timber land at 1½%. In unorganized (non-municipal) areas, Ontario levies a property tax of 1½% of assessed value; the minimum annual tax in respect of any land is \$6. New Brunswick levies a tax of \$1.50 per \$100 market value assessment on all land and buildings in the province and a similar tax on business occupancy, as a source of provincial revenue. Prince Edward Island levies a tax of \$1.10 per \$100 market value assessment on all land and buildings in the province and a similar tax on business occupancy. Farm land owned and cultivated by a bona fide farmer has a special farm assessment instead of market value assessment.

Race track taxes. Ontario levies a tax on operators of race meets and on holders of winning tickets issued under the pari-mutuel system. Holders of winning tickets must pay a tax equal to 7% of the amount that would be payable to them if no percentage were deducted by the person holding the race meet. A number of other provinces levy a pari-mutuel tax on money bet in the province on horse races: in Newfoundland the rate is 11%; in Prince Edward Island 11½%; in Nova Scotia 11% on the first \$400,000 wagered and a reduced percentage on any additional money wagered (some of this money is refundable to the individual race tracks); in New Brunswick 11% less commission of 8%; in Manitoba 10% less commission of 15% on the first \$10 million and 5% thereafter; in Alberta 5%; in Saskatchewan 10%; and in Quebec 7% on ordinary pools and 9% on special pools (quinella and daily-double). In British Columbia the tax is 8% of which 1% is earmarked to increase the purses of horses bred, born and raised in British Columbia.

Miscellaneous provincial taxes. In Newfoundland a tax of 7% is levied on premiums paid for all types of insurance except life, accident and sickness, and marine; and a telegraph tax is levied on companies operating cables or wireless stations between Newfoundland and points outside the province at the yearly rate of \$4,000 per cable or station.

In Prince Edward Island a fire marshal's tax is levied at the rate of three fourths of 1% on premiums paid for fire insurance. In Nova Scotia a fire marshal's tax is levied at the rate of one half of 1% on premiums paid for fire insurance in the province. A tax is also levied on long-distance telephone calls at the rate of five cents on the first 50 cents with a five-cent minimum and five cents on each additional 50 cents, applying only to calls made within the province.

20.6.3 Local taxes

Municipalities in Canada levy taxes on the owners of property situated within their jurisdiction according to the assessed value of such property. Methods of determining assessed value vary widely but for taxation purposes it is generally considered to be a percentage of the actual value or, as in Nova Scotia and New Brunswick, of the actual market value. The revenues from such taxes are used generally to pay for street maintenance, schools, police and

fire protection, snow removal in certain communities and other community services; in New Brunswick the municipal levy is used only for property service. Special levies are sometimes made on the basis of street frontage to pay for local improvements to the property, such as sidewalks, roads and sewers. Not only is there a widespread difference in the bases used for property tax but the rates applied vary widely depending on the municipality.

In addition to the taxes described above, municipalities usually impose a charge for water consumption by each property holder or a water tax based upon the rental value of the property occupied. In New Brunswick, utilities (water, domestic sewerage and treatment, and electric power) must be financed on a user-charge basis; a part of the water budget may be transferred to the general budget on a hydrant-rental basis or a percentage of the budget, depending on the size of the municipal population. There are no municipal income taxes although certain localities have retained the use of a poll tax. In Newfoundland, Quebec and Saskatchewan, municipalities are empowered to levy an amusement tax on the admission of persons to places of entertainment, although the amusement tax is generally a provincial preserve. Electricity and gas are taxed at the consumer level in some western municipalities and in some New Brunswick municipalities, and coal and fuel oil for heating purposes are chargeable in urban areas of Newfoundland. Telephone subscribers are subject to a special levy in Montreal and certain Ontario municipalities impose a tax on the gross receipts of telephone companies.

In most municipalities, a tax is levied directly on the tenant or the operator of a business. In general, business tax rates are lower than those applying to property. In New Brunswick, business assessment is equal to the value of the real property occupied for business purposes. Three bases of assessment are in use — a fraction of the property assessment, the annual rental value of the premises, or the area of the premises. Certain municipalities may charge a licence fee instead of a business tax but others charge both a licence fee and a business tax.

	100,000	37,690	11,851

¹ It is assumed that all income is from salary or wages and all taxpayers take the standard deduction of \$100 and the employment expense deduction. No account has been taken of other deductions such as for child care expenses, unemployment insurance contributions or the additional old age deduction.² Federal tax is for income earned in any province except Quebec. The special 3% reduction in 1972 has been taken into account.³ The provincial income tax is calculated at 30.5% of federal tax otherwise payable (i.e., before the special reduction of 3% for 1972). Some provinces impose tax at a rate higher than 30.5%.

20.25 Special excise taxes levied as at Dec. 31, 1972

Item	Tax
Cigarettes	3¢ per 5 cigs.
Cigars	17½% ad valorem
Pipe tobacco, cut tobacco, snuff	90¢ per lb.
Jewellery, including articles of ivory, amber, shell, precious or semi-precious stones, clocks, watches, goldsmiths' and silversmiths' products, except gold-plated or silver-plated ware for the preparation or serving of food or drink	10% ad valorem
Lighters	10¢ per lighter
Playing cards	20¢ per pack
Slot machines — coin, disc or token-operated games or amusement devices	10% ad valorem
Matches	10% ad valorem
Tobacco, pipes, cigar and cigarette holders and cigarette rolling devices	10% ad valorem
Toilet articles, including cosmetics, perfumes, shaving creams, antiseptics, etc.	10% ad valorem
Wines ¹	
Wines of all kinds containing not more than 7% absolute alcohol by volume	25¢ per gal
Non-sparkling wines containing more than 7% absolute alcohol by volume but not more than 40% proof spirit	50¢ per gal
Sparkling wines	\$2.50 per gal
Wines (additional excise taxes) ²	
Wines of all kinds containing not more than 7% absolute alcohol by volume	2½¢ per gal
Wines of all kinds containing more than 7% absolute alcohol by volume	5¢ per gal
Insurance premiums paid to British or foreign companies not authorized to transact business in Canada or to non-resident agents of authorized British or foreign companies	10% of net premium for property surety, fidelity and liability insurance. (Most other kinds of insurance are exempt.)

All the foregoing items, except insurance premiums, are also subject to the general sales tax of 12%. Cigarettes, cigars and tobacco are subject to additional taxes under the Excise Act (referred to as excise duties).

¹ These taxes apply only to wines manufactured in Canada. The customs tariff on wines includes a levy on imported wines to correspond to the taxes on domestic production.

² These taxes apply to both domestic and imported wines.

Chapter 21

Selected economic indicators

In this chapter various statistical statements and studies are presented in which broad areas of Canadian economic activity are covered in a comprehensive but summary form. The chapter is based on the Canadian System of National Accounts (SNA), which consists of national income and expenditure accounts, indexes of real domestic product, the balance of international payments, and financial flows. Input-output tables are also part of the System of National Accounts, but have not been included in this analysis. The integrated aggregative economic accounts provide an interrelated framework for analysis of the Canadian economy and its relationship with other countries. In its broad outline, the Canadian System of National Accounts bears a close relationship to the international standard as described in the United Nations publication *A system of national accounts*. To complete the economic picture, a section on price indexes is also included.

21.1 National income and expenditure

National income and expenditure accounts provide accounting summaries for the nation as a whole and portray economic activity in terms of transactions taking place between major groups of transactors, namely, governments, corporate and government business enterprises, persons and unincorporated businesses and non-residents. By combining and summarizing these operations into their various classes, information may be obtained on the functioning of the economy which is of particular interest to governments concerned with problems of unemployment, taxation and prices, and to businessmen concerned with programs of investment and marketing.

Tables 21.1-21.9 are based on the revised historical series of the national income and expenditure accounts. Coverage since 1926 is available in Statistics Canada occasional publication *Canadian statistical review, historical summary 1970* (Catalogue No. 11-505). A special publication of a complete set of historical tables is in preparation and may be ordered from the Gross National Product Division of Statistics Canada.

National income. Net national income at factor cost measures the current earnings of Canadian factors of production (land, labour and capital) from productive activity. It includes wages and salaries, profits, interest, net rent and net income of farm and non-farm unincorporated business.

Gross national product (GNP), by totalling all costs arising in production, measures the market value of all final goods and services produced in the current period by Canadian factors of production. It is equal to national income plus net indirect taxes (indirect taxes less subsidies), plus capital consumption allowances and miscellaneous valuation adjustments.

Personal income is the sum of current receipts of income whether or not these receipts represent earnings from production. It includes transfer payments from government (such as family allowances, unemployment insurance benefits and war service gratuities) in addition to wages and salaries, net income of farm and non-farm unincorporated business, interest, dividends and net rental income of persons. It does not include undistributed profits of corporations and other elements of the national income not paid out to persons.

Gross national expenditure (GNE) measures the same aggregate as gross national product, namely, total production of final goods and services at market prices, by tracing the disposition of production through final sales to persons, to governments, to business on capital account (including changes in inventories) and to non-residents (exports). Imports of goods and services, including payments of interest and dividends to non-residents, are deducted since the purpose is to measure only Canadian production.

21.1.1 Economic activity in 1972

A second year of brisk economic activity, supported by continuing strong domestic demand, carried the gross national product over the \$100,000 million mark in 1972. Preliminary estimates indicate the same real rate of growth of 5.8% as in 1971, in spite of certain adverse factors including a number of work interruptions and a decline in agricultural production. The output growth was accompanied by the largest employment gains since 1969,

although almost equally large increases in the labour force prevented the unemployment rate from falling significantly. The expansion of production was accompanied by renewed price pressure.

Gross national product at market prices rose by 10.7% in 1972 to reach a level of \$103.407 million. This advance, the largest since 1966, compared with a 9.1% increase in 1971. Nearly half of the dollar gain reflected higher prices, particularly evident in the food, construction and some merchandise exports components of demand, rather than rising volume of production. The rise in the implicit price index for GNP of 4.6% compared with a rise of 3.1% in 1971 and of 4.6% and 4.4% in the inflationary years 1970 and 1969, respectively.

In a continuing climate of expansionary fiscal and monetary policies, the forces of demand and production in 1972 generally followed the pattern of the previous year. Consumer outlays accelerated sharply in both years, in line with unusually strong growth in personal disposable income which was again boosted by record increases in transfer payments in 1972. Housing outlays continued very strong as did government current expenditure, while increases in business investment on plant and equipment remained relatively modest. Domestic demand again outpaced production in 1972, resulting in a further deterioration in the balance of transactions in goods and services with non-residents, from a reduced surplus in 1971 to a deficit in 1972. Highlighting the income side in both years were very sharp increases in corporation profits and accelerated rises in labour income.

Although the economy has been growing strongly in the last two years, the quarterly distribution of the gains has been rather erratic. In 1972, the strength of demand was largely concentrated in the second and in the fourth quarters, which showed volume gains of 1.9% and 2.9%, respectively. These gains were in especially sharp contrast to the marginal increase of 0.2% shown by the third quarter estimate. Much of the volatility in aggregate demand was apparently due to merchandise exports, which were affected by strikes at home and abroad and by other work interruptions and to the uneven pace of consumer purchases of durable goods, especially automobiles.

21.1.2 Consumer demand

In 1972, consumers spent \$6,288 million more on goods and services than in 1971 — an increase of 11.6%. This was greatly in excess of any gain recorded in the 1960s and compared with a 7.8% increase in 1971. Even after removing the effect of increasing prices — up 3.5% after a small 2.2% increase in 1971 — the volume gain of 7.8% was the strongest since 1955. This upsurge in consumer spending was very widely based as all major categories of personal expenditure showed unusually high rates of increase, ranging from 9.7% for services to 16.1% for durable goods. The goods categories as a whole showed a 12.9% increase. The growth in consumer outlays, spectacular as it was, fell short of the 11.8% growth in personal disposable income, resulting in a small increase in the already historically high personal saving ratio (personal saving as a proportion of personal disposable income) from 7.6% to 7.7%.

As in the previous year, expenditure on durable goods paced the advance, but the gains within that group were much more widespread in 1972. Expenditure on new passenger cars continued to increase strongly, up 15.5% after a 27.0% increase in 1971; most other durable goods showed sharp rises, in particular, furniture and household appliances, in line with the continuing boom in new housing. Widespread increases in expenditure were noted in semi-durable goods, up 12.3%, and in non-durable goods, up 11.7%. In the latter group, a 13.0% increase in food outlays was due largely to sharp price rises.

21.1.3 Government demand

Government current spending on goods and services rose by 11.1%, about the same rate as in 1971. The major increases took place at the provincial and local levels and reflected mainly higher wage and salary payments, including substantial retroactive amounts. The increase in capital outlays of governments, on the other hand, was much smaller than in 1971.

Increases in government transfer payments to persons, mainly at the federal level, had a sharp expansionary effect on the economy. Unemployment insurance benefits more than doubled in 1972.

21.1.4 Business fixed capital outlays

The housing sector, supported by continuing favourable financing conditions, was another factor contributing strongly to the current economic expansion. Housing starts realized a new record at almost 250,000 units. Outlays rose by 17.5% in 1972, following a 26.2%

increase in the previous year. However, much of the increase in 1972 reflected sharp price increases, especially of lumber. The increase in the volume of residential construction as measured in constant dollars rose by 9.1% compared with 18.9% in 1971. The increase in 1972 was concentrated in the construction of single dwellings, in contrast to the previous year when apartment construction contributed almost equally to the expansion.

In contrast to housing, the increase in business plant and equipment spending remained relatively modest in 1972. These outlays rose by 6.5% compared with 7.7% in 1971. Spending on non-residential construction, affected by strikes, slowed considerably from a 10.5% increase in 1971 to 2.9% in 1972. This represented a decline in real terms. Spending on machinery and equipment, on the other hand, rose by 9.9%, the highest increase of the last three years. Outlays on commercial vehicles, passenger vehicles for business use, farm implements and non-farm imported machinery were especially strong.

21.1.5 Inventory investment

The rate of investment in non-farm business inventories rose from \$202 million to \$764 million. This was the first such increase in this investment since 1969. For the year as a whole, the major part of the investment was concentrated in dealer holdings of durable goods. Although stocks of manufacturers increased moderately, the stock-to-shipments ratio in 1972 was much below the ratio of the preceding year. Over one third of the investments in non-farm business inventories took place in the first quarter of the year.

21.1.6 Exports and imports

In the external sector, both exports and imports of goods and services in total rose at accelerated rates; however, the faster rate of increase in imports resulted in a sharp deterioration in the balance from a surplus of \$177 million in 1971 to a deficit of \$808 million. Most of the swing occurred in the merchandise account. Although merchandise exports rose by 11.9% — almost twice the rate of the previous year — merchandise imports rose even faster, by 19.6%.

Among exports, notable increases were recorded in crude petroleum and lumber. In imports, there were notable increases in machinery and equipment, in line with strong rises in this type of investment. An extended shutdown of a major automobile plant in Canada in the third quarter to change its product line also contributed to the swing of the merchandise balance.

21.1.7 Incomes

Most income components displayed sizable gains in 1972. Labour income, which accounts for over half of GNP, rose by \$5,518 million, or 10.7%, to a level of \$56,849 million. This was the largest percentage increase since 1969 and compared with gains of less than 10.0% in the two previous years. The acceleration was due entirely to widespread sharp increases in the service-producing industries, especially in trade, up 12.8% compared with 8.4% in 1971, and in public administration, up 14.9%, about the same as in the previous year. The growth of wages and salaries in the goods-producing industries, up 8.3% compared with 8.5% in 1971, was slowed by industrial disputes in construction and mining. However, wages and salaries in manufacturing rose by 9.9% — a significant acceleration over the previous two years and slightly above the rate recorded in 1969.

Preliminary estimates of corporation profits indicate an increase of about 21.0%. This gain, the largest since 1955, occurred following an already sizable increase of 16.2% in 1971. Although industrial detail is not yet available, there are indications that the gains were widespread. As a proportion of GNP, corporation profits declined to low levels in 1969 and 1970, but sharp gains in 1971 and 1972 re-established this proportion at 10.5%, only slightly less than that of 10.7% in 1968. A larger proportion of the increase in business income in the last two years reflected sharp gains in inventory valuation due to rising prices. The inventory valuation adjustment, a negative correction to GNP in periods of rising prices, to remove that part of the increased value of stocks not due to current production, rose sharply in the last two years.

21.1.8 Price movements

The implicit price index of gross national expenditure rose 4.6% for the year, a considerable acceleration from the 3.1% experienced in 1971. The implicit price index for personal expenditure rose by 3.5% compared with 2.2% in 1971. This acceleration stemmed

mainly from food prices, which were 8.0% higher in the year, the largest rate of increase in over a decade. This was reflected in a jump in the implicit price index for non-durable goods from a 1.7% increase in 1971 to a 5.1% increase in 1972. In other categories, the most important price acceleration occurred in semi-durables, from 1.9% to 2.7%. In durable goods, an accelerated rise in the price of furniture was largely offset by a moderation in the rate of increase of car prices.

Prices of exports which had risen marginally in 1971 rose by 2.9% in 1972. The majority of components of the merchandise price index accelerated, with particularly sharp rises in prices of food and lumber products. Most metals, on the other hand, showed price deceleration. The service component, which has a lower weight in the over-all price index, rose by a strong 6.0%. The price rise in the import index of 2.6% remained moderate, due in large part to price moderation in the United States following the adoption of price control measures.

The implicit price for current government expenditure rose 7.4% over the year, higher than the 5.8% 1971 increase. The increase of the wage component of 9.0% contributed most to this price rise. Higher retroactive payments in 1972 included in this item resulted in an acceleration in the price rise compared to 1971; however, strike effects in the second quarter offset the impact of these wage settlements.

The implicit price index for business gross fixed capital formation rose 5.0%, but this upward pressure on prices was concentrated in construction prices as the machinery and equipment component, reflecting its high import content, rose a modest 2.5%, a lesser rate than in 1971.

With continued strong demand, residential construction prices rose 7.7%, an acceleration from the 6.1% increase in 1971, while non-residential construction prices, where there was relatively weak demand, advanced 6.1%, the same as 1971. Labour prices rose at decelerated rates compared to 1971, so that the main impetus behind the surge in prices was due to higher material costs. The 15.2% increase in lumber prices boosted residential material prices to the highest level of the decade.

21.1.9 The government sector

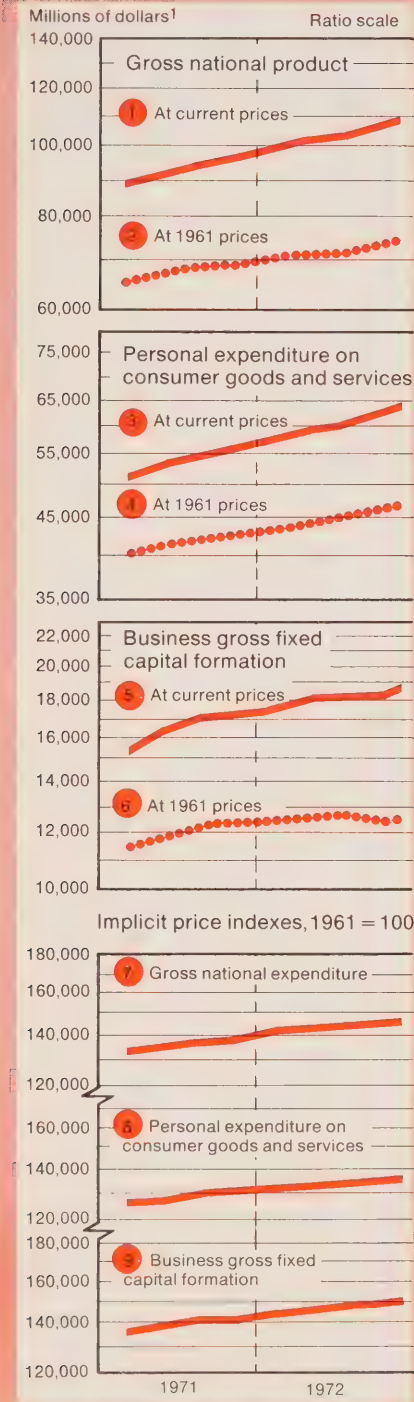

Total expenditure of all levels of government combined (excluding intergovernmental transfers) rose by 13.0% in 1972, which was about the same rate as in the previous year. Increased outlays on goods and services contributed the largest amount to the increase and reflected mainly higher wage and salary payments, including substantial retroactive amounts. Current outlays rose at about the same rate as in 1971. Increases in capital outlays, which were considerably smaller in 1972 than in 1971, were of similar magnitude at the federal and provincial levels.

The other major increase in expenditures occurred in transfer payments to persons. The rise, the highest in some years, was concentrated at the federal level. Unemployment insurance benefits paid were more than double those in 1972 under the effect of the introduction of new unemployment insurance legislation and the continuing high levels of unemployment. Other factors in the rise of federal transfers to persons were higher old age security pension rates and the introduction of the Local Initiatives Program. The increase at the provincial level was the lowest in some years as the rate of increase in grants to post-secondary educational institutions slowed and property tax credits replaced cash basic shelter grants within the income tax system.

Total revenues rose by just under 11.0% in 1972, about the same as the 1971 rate of increase. Returns from personal direct taxes and indirect taxes contributed about equally to the increase. The increase in personal direct taxes was slightly lower than in the previous year, reflecting tax rate cuts made at both the federal and provincial levels. Indirect taxes rose much more sharply than in the previous year, reflecting higher sales and some increased rates. All other revenue categories showed gains with the exception of other current transfers from persons, which declined, due mainly to the elimination of hospital and medical care premiums for the aged in Ontario.

With expenditures rising more sharply than revenues, the government sector, on a national accounts basis and including the Canada and Quebec Pension Plans, moved from a surplus of \$100 million in 1971 to a deficit of \$634 million in 1972. The deficits of the federal, provincial and local governments all widened during the year. The surplus of the Canada and Quebec Pension Plans rose from \$1,278 million to \$1,374 million, an increase similar to those of recent years.

Selected indicators—seasonally adjusted

1. At annual rates.

21.2 Domestic product by industry

21.2.1 Indexes of real domestic product

Since the early 1960s Statistics Canada has published a set of production data pertaining to the entire spectrum of Canadian industries in its full industry detail (including the index of industrial production). These data, in the form of production indexes, are measures of value added for each industry revalued in the dollars of the base year. Technically, they are termed "indexes of real domestic product (RDP) at factor cost originating by industry". In constructing the index for total RDP, where the gross output of one industry flows to another industry (intermediate input) and/or to final demand (non-industrial sales), the portion double-counted has been eliminated. This is accomplished by subtracting the intermediate inputs (materials, fuels, advertising, etc.) valued in terms of the dollars of a common base year from the constant dollar value of the gross output to yield a constant dollar value added aggregate.

RDP indexes are published on an annual, a quarterly and a monthly basis. The monthly and quarterly data are published both seasonally adjusted and without seasonal adjustment. The seasonally adjusted data are considered to be preferable for the analysis of emerging trends, as the strong seasonal fluctuations to which sub-annual data are frequently subject have been removed through the seasonal adjustment process, thus revealing the underlying trend as well as the cyclical and irregular factors affecting the data. In general, the annual indexes are suitable for studies of production trends, growth rates and inter-industry comparisons, whereas monthly indexes provide a much better tool for the study of the cyclical behaviour of industries and short-term changes in production.

Recent performance. Spurred on by strong domestic and foreign demand for the goods and services produced by Canadian industries throughout most of the decade since 1961, total real output in the 1961-72 period achieved an average annual rate of gain of 5.7% in contrast to the average rate of growth of 4.7% in the 1946-61 period. Domestic demand has been influenced by demographic factors operating since World War II; younger age groups are displaying both their purchasing power and changing tastes. Buoyant foreign demand for Canadian commodities has been a dominant force since 1961, with sales of wheat and motor vehicles and parts having recorded the most dramatic gains over the past eleven years. Within this period a generally healthy investment climate has prevailed. Both residential and non-residential construction made good gains. However, in the case of non-residential construction, the rapid pace of activity peaked in 1966 and various inhibiting factors have contributed to weakness in this industry since then. The durable manufacturing sector was particularly dynamic in response to both domestic and external demands.

The influx of the postwar generation is also reflected in the rapid increase in the labour force. Over most of the period, the expanding economy generated sufficient employment opportunities to adequately absorb the increases in the labour force. Some slackness in the over-all economy developed in the latter part of the 1960s with the result that, among other things, the growth in labour force employment has tended to fall below the rate of increase in the labour force itself.

The rate of growth of the economy decelerated in 1970, but picked up in 1971. The momentum was reasonably sustained in 1972. Real domestic product increased by 5.3% in 1972, following a rise of 5.7% in 1971. Such rates of growth still exceed the long-term growth rate for the postwar period (Table 21.10).

Manufacturing and, in particular, durable goods manufacturing, has been a leading contributor to the growth of the Canadian economy over most of the period. The burgeoning motor vehicles and motor vehicle parts industries have been prime movers in the rapid increase in the output of durables. A severe interruption in the strong upward trend in motor vehicle production occurred early in 1966 and persisted until the final quarter of 1966. It has been variously attributed to changes in the general economic conditions in North America and specifically to the 1966 credit squeeze and the upward climb of prices, combined with consumer concern about car safety. Since 1968, production has been hit, directly or indirectly, by strikes and parts shortages, and in 1970 output declined markedly as a result of a slump in consumer spending compounded by the impact of the automobile strike in the latter part of the year. There was a strong recovery early in 1971 which raised the level for the year well above that for 1969 (Table 21.11). This industry made further good gains in 1972 despite an

interruption in the second half of the year to permit a major producer to alter its product lines.

The performance of the construction industry has been a conspicuous feature of the economy. Heavy injections of industrial capital took place in the mid-1960s to develop additional facilities or expand capacity. Pace-setters were such industries as petroleum and coal products, chemicals, pulp and paper, and electric power. Outlays for social capital such as hospitals and educational institutions also increased. Construction projects for Canada's Centennial and Expo 67 provided an extra stimulus. However, since 1967, tightened monetary conditions, rising costs, a mid-1969 decision to defer capital-cost allowances on commercial projects in some areas, and strikes in 1969, 1970 and 1972, all restrained output in this sector. Residential construction tends to be one of the more volatile sectors of the economy. The relevant demographic factors have indicated that a solid demand for housing exists. However, less favourable supply conditions such as scarcity of mortgage funds and rising interest rates and construction costs have, from time to time, adversely affected residential construction, particularly in 1966, the latter half of 1969 and the first half of 1970. Strikes in 1970 and, to a lesser extent in 1972, exacerbated the situation. However, increased availability of both private and public mortgage funds in the latter part of 1970 prompted a sharp upswing. This strong advance continued in 1971 and 1972, providing an impetus for increasing growth in other sectors of the economy.

The community, business and personal services group has grown at a fairly steady pace in the past decade, tending to be relatively insensitive to short-term fluctuations, and has thus been one of the sustaining forces in the economy. The rate of increase in output of this industry grouping in 1970 outstripped that of the aggregate output of the economy, paced by such industries as health and welfare, education and services to business management. In 1971 and 1972, with the general acceleration in business activity, the traditional growth industries again outpaced the increase in this industry group.

The slowdown in the 1970 growth rate of total real domestic product occurred during the first three quarters of the year. The pick-up in activity in the final quarter was highlighted by the resurgence in residential construction which mitigated the impact of the automobile strike.

In summary, since the end of 1970 total production has increased strongly. At the aggregate level, there was renewed strength in domestic demand. Exports of some significant commodities were lower, dampening production in such export-oriented industries as metal mines and pulp and paper in 1971. Newsprint exports increased in 1972 for the first time since 1969. On the other hand, exports of wheat, coal, crude petroleum and natural gas, among others, continued to increase strongly. In 1972, the service-producing industries, on the strength of a 6.0% gain, accounted for the greater part of the change in aggregate real domestic product, led by trade, finance, insurance and real estate, and transportation. The increase in trade was shared by both wholesale and retail trade. Within retail trade, there was particularly strong demand for the goods and services of motor vehicle dealers, department stores, and furniture, TV and radio stores. Within goods, there was considerable strength in manufacturing industries, whose output rose at a rate exceeding that of the service-producing industries, as did the output of electric power, gas and water utilities. The gains in manufacturing were fairly evenly attributable to both durables and non-durables manufacturing. Residential construction recorded a solid gain in 1972, with housing starts up by 7.0%. This followed the burst of activity in 1971 when housing starts had posted a 23.0% increase. The advance in residential construction activity in 1972 provided support for the production of building materials and household appliances, as reflected in the gains in such manufacturing industries as wood products, concrete products, cement and major appliances.

21.2.2 Value added for goods-producing industries

The data contained in this Section are published in Statistics Canada report *Survey of production* (Catalogue No. 61-202); data on census value added in selected industries on a "total activity" basis appear in the Appendix to the 1970 issue. The scope of the survey of production is limited to industries engaged chiefly in the production of goods and it measures production in current dollars. This is in contrast to the real domestic product series which encompasses all industries and measures production in terms of the dollars of a base year — the "constant dollar" calculation.

Tables 21.12 and 21.13 give "census value added" production data, classified by province and industry, respectively, on a primary activity basis. Census value added is derived by

deducting the cost of materials from the gross value of production (excluding excise and other sales taxes) or revenue. The 1960 Standard Industrial Classification of establishments is the basis of classification in the survey of production.

Current dollar census value added in the goods-producing industries increased by 2.1% in 1970, compared to the 9.1% annual increase recorded in 1969. Most of the slowdown was caused by a 0.4% decline in manufacturing.

21.2.3 Aggregate productivity trends

The level of, and changes in, productivity have a vital influence on economic growth, over-all cost-structure, international competitiveness and, in the final analysis, on the quality of life. In the measurement of productivity, output is related to one or more kinds of inputs utilized in the production process.

Although these measures of productivity relate output to a single input only, namely labour time, it must be emphasized that changes in output per unit of labour input cannot be attributed directly and solely to labour. Such measures reflect not only changes in the skills and effort of the labour force but also the contribution of other productive resources with which labour works as well as the effectiveness with which all are combined and organized for the purpose of production. In other words, changes in technology, capital investment, capacity utilization, work flow, managerial skills and labour-management relations each have a bearing on movements in what is termed "labour productivity".

Sources of data. The output components of the various indexes of output per unit of labour input referred to here are the indexes of "real domestic product (RDP) by industry". These indexes, which were developed within the conceptual framework of the Canadian System of National Accounts and which measure in constant dollar terms the unduplicated contribution of each component industry to total output, are considered basically suitable for productivity measurement when matched with the corresponding input measures.

The major sources for the employment and man-hour indexes were the monthly labour force and employment surveys, and these were supplemented by data from such sources as the annual censuses of manufactures and mining and the decennial census of population. Since the data from these diverse sources varied considerably in their coverage, concepts and methods of compilation, care had to be exercised in their selection, adaptation and combination into aggregate measures of labour input which would be conceptually and statistically consistent, both internally and in relation to the output data. Labour force survey data were used for the paid worker estimates of agriculture and of fishing and trapping, while those for manufacturing and mining were based on adjusted annual census data. Estimates for most of the remaining industry divisions were derived from employment survey data. Estimates of other than paid workers (own-account workers, employers and unpaid family workers) were derived mainly from the labour force survey. Estimates of average hours worked, which were needed for the indexes of output per man-hour, were also based on labour force survey data, except in the case of manufacturing, where man-hours data reported in the census of manufactures were also utilized. Indexes of output per person employed in commercial industries for 1946-72 are given in Table 21.14.

Growth rates. Between 1961 and 1972, output per person employed in the commercial industries increased at an average annual rate of 3.4%. Output per man-hour rose at a faster rate, 4.2%, due to a decrease in the length of the average work week (Table 21.15). During the past twelve years the rate of productivity increase has fallen off. The annual growth of 3.8% in output per person employed during the 1961-66 period dropped to 3.2% between 1966 and 1972. Corresponding rates for output per man-hour were 4.5% and 4.2%.

Productivity growth in the commercial service-producing industries continued to lag behind the comparable rate of increase in the goods-producing industries. From 1961 to 1972, the average annual rate of increase in output per person employed was 1.9% in the service sector and 4.7% in the goods sector. During the same period, output per man-hour increased 2.9% and 5.4%, respectively. In manufacturing, from 1961 to 1972 output per person rose 4.1% annually, while the growth in output per man-hour was 4.3%.

21.3 Price indexes

Price indexes express prices for a given period as a percentage of prices in a designated base period and consequently measure the movement of prices from one period to another. A

Selected indicators

Price indexes Indexes 1961 = 100
(Not adjusted for seasonality)

Price indexes
(Not adjusted for seasonality)

less frequent type of price index expresses prices in one location as a percentage of prices in a base location, which is set equal to 100, and measures the comparative levels of prices between different places at a fixed point in time.

21.3.1 Consumer price index

The purpose of the consumer price index is to measure the movement from month to month in retail prices of goods and services bought by a representative cross-section of the Canadian urban population. For a particular article or service, a price index number is simply the price of the article in one period of time expressed as a percentage of its price in a reference period, usually called a base period. However, indexes for individual goods may be combined to form indexes representing price movements of broad groups of goods and services. Thus, the consumer price index relates to the wide range of goods and services bought by Canadian urban families.

The group of goods and services represented in the index is called the index "basket" and "weights" are assigned to the price indexes of individual items for purposes of combining them into an over-all or composite index. The weights reflect the relative importance of items in expenditures of middle-size urban families with medium incomes. The basket is an

unchanging or equivalent quantity and quality of goods and services. Only prices change from month to month and the index, therefore, measures the effect of changing prices on the cost of purchasing the fixed basket. The baskets and weights on which the index is based from 1961 to April 1973 relate to 1957 spending patterns. From April 1973 forward, the index basket and weights will be based on expenditures in 1967 of families ranging in size from two to six persons, with annual incomes of \$4,000 to \$12,000, living in urban centres with metropolitan populations exceeding 30,000.

The movement of the consumer price index during the period 1961-71 is described in previous editions of the *Canada Year Book*. From 1971 to 1972, the annual average consumer price index increased by 4.8% which compares with an average increase in the preceding five years of 3.7%. On the basis of the movement in consumer prices, the purchasing power of the 1961 consumer dollar dropped from 75 cents in 1971 to 72 cents in 1972.

The major cause of the above-average increase in the consumer price index from 1971 to 1972 was a sharp rise in the rate of advance of the heavily weighted food component. The movements in the other components from 1971 to 1972 were roughly similar to the average increases of recent years. Table 21.16 presents indexes for major components and the all-items index for the period 1961 to 1972. In this classification, the index items are grouped according to broad categories of use by the consumer.

Items in the index may also be grouped by type of commodity and service, which permits another view of the incidence of changes in prices (Table 21.17). From 1971 to 1972 the goods index rose 4.6%, compared with an average rise of 2.7% for the preceding five years. The main cause of the above-average increase was a 7.6% rise in food prices, which was considerably more than the 2.4% rise on average for the preceding five years. Prices of non-durable goods excluding food, semi-durable goods, and durable goods increased 2.9%, 2.4% and 1.2%, respectively. The average increase over the preceding five years for these goods groupings were 3.4%, 2.8% and 1.7%, respectively. The services index rose 5.2% between 1971 and 1972 with the five-year average being 5.6%.

Table 21.18 presents regional consumer prices for 12 cities or city combinations. These indexes do not show whether it costs more or less to live in one city than in another and should not be used for such comparisons. Their function is to measure percentage changes in retail prices — over a certain time in each city or city combination — of a fixed basket of goods and services representing the level of consumption of a particular group of families. Indexes which compare price levels among major Canadian cities are given in Section 21.3.2.

In order to place movements in Canadian retail prices in perspective they may be compared with price changes occurring elsewhere in the world. This is done in Table 21.19, which indicates the percentage changes over the previous year in the consumer price index for each country specified. For purposes of comparison countries are listed alphabetically, by region. It should be noted that all percentages are rounded to the nearest whole number.

21.3.2 Intercity retail price differentials

As noted in the previous section, the regional city price indexes given in Table 21.18 measure the movements of consumer prices within each city and cannot be used to compare levels of prices between cities. Indexes that do compare levels of prices among 11 major Canadian cities are given in Table 21.20. These indexes express prices in each city as a percentage of prices in Winnipeg as at May 1971, with Winnipeg prices at that date set equal to 100. The selection of Winnipeg as the base city has no special significance; the indexes may be expressed on the base of any of the individual cities included. The selected commodity groupings shown make up about three quarters of the average urban consumer budget, the most important omissions, for technical reasons, being shelter (rented and owned), fuel, light and water, and restaurant meals.

The retail prices from which the indexes were derived are largely those collected in each city for production of the consumer price index. The main exception to this is food at home where the retail prices were obtained from a special ad hoc survey in May 1971. Comparability between cities was achieved by matching, as far as possible, quotations for similar qualities of goods and services and types of retail outlets. Since prices compared include sales and excise taxes as applicable, variations between provinces in the scale of sales taxes imposed on a wide range of non-food commodities can be of significance in explaining intercity price differentials for these items.

21.3.3 Consumer expenditure

Household surveys of family expenditure provide information on consumer spending that can be related to family characteristics, such as geographical location, family size, income level, etc. In general, a survey program has consisted of two phases – the collection by means of monthly record-keeping surveys throughout the reference year of detailed information on family food expenditures, and the collection of information by annual recall of all family expenditure, income and change in assets and liabilities. In 1953, the small-scale continuing survey was initiated, and until 1968 seven survey programs were conducted. In three survey years (1959, 1964 and 1967) the monthly surveys were omitted and the annual recall surveys were enlarged in size and scope to refer to all families and individuals regardless of family type or income.

A primary purpose of such surveys is to provide information for constructing, reviewing and revising the weights of consumer price indexes. In more recent years a growing demand for expenditure statistics to serve other needs of government, business, welfare organizations and academic research culminated in the expansion of the 1969-70 survey program to provide a large-scale national survey for the first time since 1948-49, covering both urban and rural households in the ten provinces; the Yukon Territory and the Northwest Territories were not included. The family expenditure survey undertaken for 1971 was designed to collect expenditures on shelter and household durable goods purchases. Family records were obtained from a sample of about 3,600 families and individuals in eight major regional cities (St. John's, Halifax, Montreal, Ottawa, Toronto, Winnipeg, Edmonton and Vancouver).

Table 21.21 presents a summary of family expenditures for families of two or more persons in eight Canadian cities, classified by family income in 1971.

21.3.4 Wholesale price index

The term "wholesale prices" refers to transactions that occur below the retail level. It relates to sales and purchases of raw materials, semi-processed goods and manufactured products. Indexes of wholesale prices are constructed in two ways: on an industry basis, in which the indexes are prepared for individual industries and aggregated for groups of industries; and on a commodity basis, in which indexes are prepared for individual commodities and aggregated for groups of commodities. "Industry selling price indexes" for manufacturing industries are the principal industry-classified indexes available in Canada. The "general wholesale index" is the major commodity-classified index.

Wholesale price indexes and individual price series have numerous uses, one of the most important of which is in escalator clauses of contracts where prices quoted are linked to movements of specified price indexes. They are also of major importance in studies of replacement and construction costs in investment projects; analyses of price movements of both individual items and commodity groups in relation to purchases and sales; industrial planning and market analysis; valuations for tax purposes and inventory analysis; and studies of changes in real production. Foreign companies also utilize the indexes in assessing the competitive position of Canadian goods.

Industry selling price indexes (manufacturing). Indexes of the selling prices of some 100 individual industries classified to manufacturing in the Standard Industrial Classification are produced and published monthly. In addition, indexes are published for 12 major groups of manufacturing industries and a composite gross weighted index for all manufacturing has been introduced recently.

The indexes measure the movements through time of prices received by manufacturers for their products. Prices reflected in the index are f.o.b. manufacturers' establishment, excluding taxes levied on manufacturers' sales. The items in the current indexes and their weights, indicating their relative importance, are based on manufacturers' shipments in 1961. The composite gross weighted index for manufacturing is presented in Table 21.22, for the years 1962-72.

The general wholesale index includes mainly manufacturers' prices but also incorporates those of wholesalers proper, assemblers of primary products, agents and operators of other types of commercial enterprises which trade in commodities of a type, or in quantities characteristic of primary marketing functions. Prices are grouped according to a commodity classification scheme based on chief component material similarities. Indexes classified according to degree of manufacture are also available. In Table 21.23, the general wholesale

index is presented for the period 1949-72. This index is used as a conventional summary figure against which to observe the behaviour of particular price groups such as farm products, raw materials and building materials, for which separate price indexes have been constructed.

World wholesale price indexes. Price changes among different countries have varied widely during the years. Comparisons of Canadian wholesale price indexes with those of other countries for the years 1970-72 are given in Table 21.24.

21.3.5 Construction and capital goods

This Section covers price indexes currently available for residential and non-residential building, and engineering construction.

Residential and non-residential building construction indexes. Two series of indexes are produced by Statistics Canada measuring price changes for residential and non-residential building construction. These are base-weighted indexes of materials and labour, and are presented in Table 21.25 for the years 1962-72.

Federal sales tax has been added to the materials indexes where appropriate. The wage rate component, from 1971 forward, is derived mainly from surveys of agreements conducted by the Canadian Construction Association for construction trades in various centres; these are base rates which reflect union scale or collective agreements. The combined indexes of materials and wage rates do not reflect changes in profit margins or in productivity; implicit price indexes from gross fixed capital formation reflecting these factors are available from the Gross National Product Division of Statistics Canada.

Highway construction indexes. The price indexes of highway construction in Canada express prices paid by provincial governments each year in contracts awarded for highway construction as a percentage of price paid in 1961. The base-weighted indexes measure the effect of price change on the cost of specified programs of new highway construction represented by contracts of approximately \$50,000 or more awarded by provincial governments. Indexes for the period 1962-71 are given in Table 21.26.

The all-items indexes and their components are useful in planning and budgeting for highway construction programs, in updating previously costed projects, in estimating replacement cost of previously completed road work and in measuring historical price trends. Prices contained in the index are for units of construction work put in place, such as a cubic yard of earth excavation or a ton of bituminous hot-mix paving. Also included are prices of some materials, such as culvert pipe, usually supplied to the contractor by the highways department. *Prices and price indexes* for December 1967 contains details of the problems of estimating price change for highway construction.

Electrical utility construction indexes. The price indexes of electrical utility construction, which include those of distribution systems, transmission lines, transformer stations and hydro-electric generating stations, give an estimate of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping electrical utilities in a specified base period. The index provides an estimate of how much more, or less, it would cost to reproduce the base-period program of construction in another period, using the same construction technology as in the base period and assuming rates of profit and productivity in construction are the same in both periods.

Price indexes for the years 1962-72 are presented in Table 21.27. Prices used in the indexes are, for the most part, selling prices reported monthly by manufacturers for materials or equipment. The price reported is for units and terms of sale representative of the volume sales of the manufacturer. Federal sales tax changes are reflected in the index but no adjustments have been made for provincial tax changes. Until December 1964, wage rate data were supplied by the Department of Labour and represented minimum hourly rates paid to construction workers in major cities employed on federal government contracts. In 1965, union basic wage rates reported by major utilities and some contractors were incorporated into the index. The sample selected provides an estimate of wage rate change for urban own-account and contract electrical utility construction.

Price indexes of machinery and equipment. A system of base-weighted price indexes for machinery and equipment has been under development for a number of years, a principal use of which would be the restatement of historical investment costs in terms of price levels of a particular year. At present, only price indexes of construction and forestry machinery and equipment have been published and are provided in Table 21.28.

Prices used in the indexes are, for the most part, selling prices reported monthly by manufacturers, although in some cases distributors' prices are used. Prices of imported machinery and equipment are included in the index, represented either by commodity price indexes of the United States Bureau of Labor Statistics or by prices collected directly from foreign manufacturers. All prices have been adjusted as relevant to include duty, exchange and federal sales tax.

21.3.6 Security price indexes

Security price indexes measure, through time, the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on the Toronto, Montreal and Canadian stock exchanges. In the case of the mining index, eligible issues are for producing mines only. The indexes in Table 21.29 express current prices as a percentage of prices in 1961.

21.4 Balance of international payments

The Canadian balance of international payments summarizes transactions between residents of Canada and those of the rest of the world. Current account transactions, which measure the flow of goods and services between Canada and other countries, are included, with minor adjustments, as a component of gross national expenditure. Capital account transactions between residents and non-residents are included in the financial flow accounts. Current account transactions are summarized in Tables 21.30 and 21.31. The Canadian balance of international payments for 1970-72 is presented in Table 21.32.

Analysis of 1971 flows. Canada recorded a reduced current account surplus of \$401 million in 1971 – a substantial decline from \$1,082 million in 1970, which had been the first surplus recorded since 1952. The size of the 1970 surplus was, however, produced mainly by a combination of several special factors which resulted in an extremely large merchandise trade surplus.

With the economy gaining strength in 1971, as evidenced by the 9.1% rise in gross national product in current dollar terms, the growth in imports outpaced that of exports. The merchandise trade surplus in 1971 therefore fell to \$2,397 million from \$3,048 million in 1970. The deficit on non-merchandise transactions continued to rise and reached \$1,996 million in 1971, up \$30 million from the previous year. On a seasonally adjusted basis, the current account balance declined throughout 1971 going from a surplus of \$343 million in the first quarter to reach a deficit of \$216 million in the last three months of the year.

Inflows of capital in long-term forms declined to \$394 million from \$742 million in 1970 and over \$2,000 million in 1969 (abstracting deliveries of securities contracted for in earlier years, the 1971 figure was only \$113 million). The main feature in this decline has been the reduction in new issues of Canadian securities sold abroad to \$1,162 million in 1971 from levels of around \$2,000 million in both 1968 and 1969 and \$1,227 million in 1970. A greater proportion of new Canadian issues was raised on the Canadian markets in both 1971 and 1970 than in 1969, reflecting the easing monetary situation in Canada and the general availability of funds at comparable cost. During this period outflows for Canadian direct investment abroad were at levels much above those prevailing prior to 1969. In addition, there were sharp increases in government loans and advances to developing countries and international investment agencies and in export credits financed directly or indirectly at risk of the Government of Canada. Factors tending to increase the long-term inflow were the continued movement of foreign direct investment into Canada at substantial rates, climbing from \$590 million in 1968 to \$885 million in 1971, and the continued disinvestment by Canadians (particularly financial institutions) of their foreign portfolio investments which led to an inflow of \$191 million in 1971. The bulk of this reduction was in US equities and coincided with a protracted decline in North American stock exchange prices.

Short-term capital movements in 1971 led to a net capital outflow of \$18 million. The principal factor accounting for the change from successive outflows was the influx of \$874 million resulting from the reduction in Canadian holdings of foreign bank balances and other short-term funds abroad, following five successive annual outflows totalling over \$3,000 million. The build-up of these balances was accelerated during periods of very high interest rates abroad, particularly Eurodollar rates. The category "other short-term capital transactions" led to a net outflow of \$1,082 million of which about 85% was accounted for by

the balancing item representing the difference between the direct measurements of the current and capital accounts.

Although the economy showed strong resurgence in Canada in 1971, it was a year of crisis on the international economic front. Over a period of some years there had evolved a series of crises of confidence in the viability of the existing international financial structure and particularly the role of the US dollar within it. These recurring crises reached a new peak in the summer of 1971 and the United States introduced new economic policy measures on August 15 to improve its domestic and international economic positions. To cushion the effect on Canadian economic activity the Canadian government in early September introduced proposals for an employment support program. At the same time Canada participated actively in efforts to reshape the international monetary system. A package involving the realignment of most major currencies vis-à-vis the US dollar was worked out in Washington in mid-December. Included in the package was a commitment by the United States to change the price of gold from US\$35 an ounce to US\$38 an ounce. Currencies would be allowed to fluctuate within 2¼% above or below their new central rates. No central rate was established for the Canadian dollar. Bilateral trade negotiations were entered into by the United States to obtain some concessions from its major trading partners.

21.4.1 Current account transactions

During 1971 a current account surplus of \$401 million was recorded, about one third the 1970 surplus of \$1,082 million, which was the first positive balance since 1952 (Table 21.30). The surplus on merchandise trade dropped by 21% but remained well over the \$2,000 million mark. The non-merchandise deficit advanced slightly to \$1,996 million.

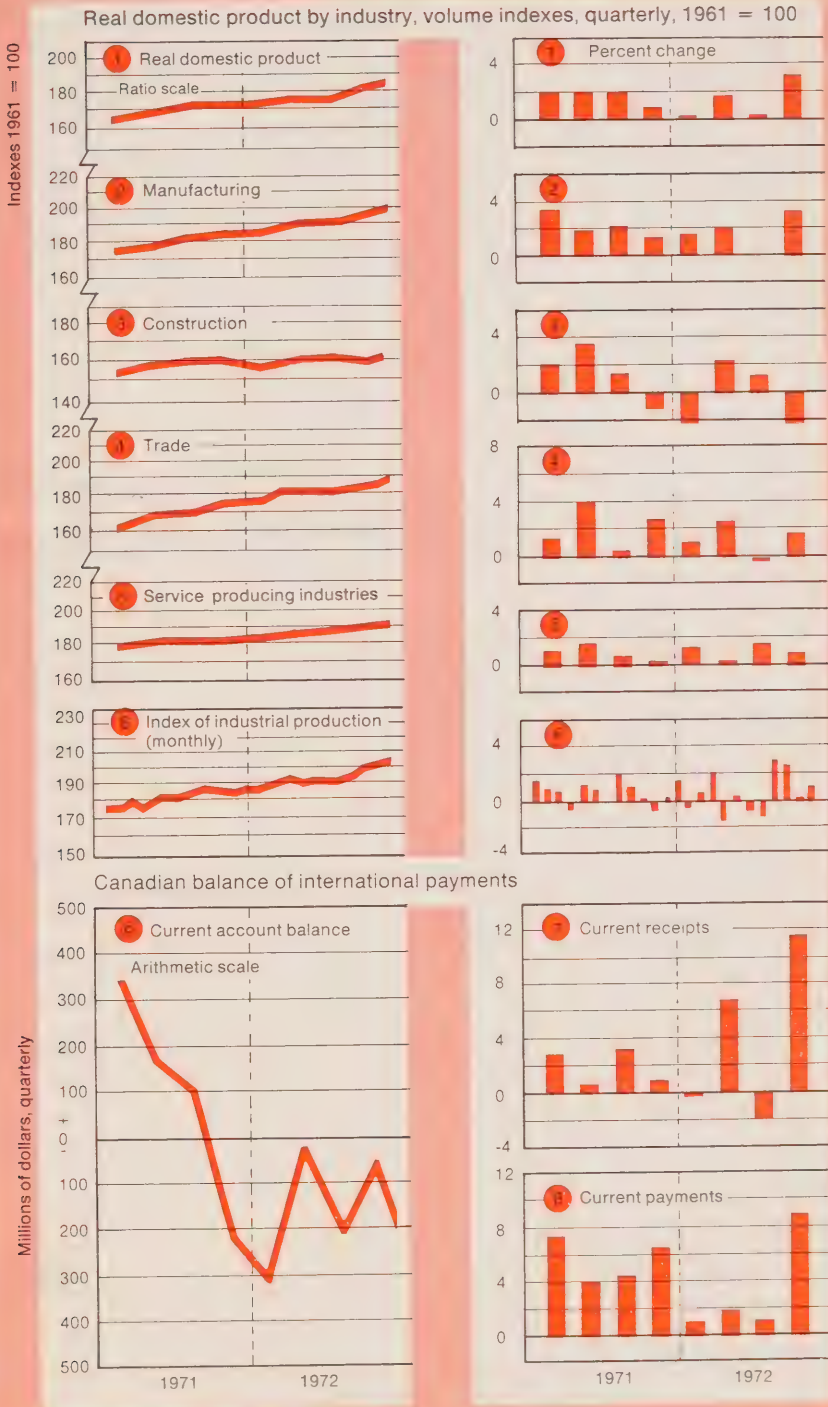

In comparing 1971 with 1970, however, it should be recognized that as far as merchandise trade was concerned, 1970 was an unusual year in a number of ways. In the first place, demand for Canadian products was influenced by foreign catch-up requirements of metals following the 1969 strikes in the mining industry in Canada. Wheat and barley shipments were influenced by drought conditions in other wheat-exporting countries and by the onset of the southern corn blight in the United States which led to lower barley yields there. Moreover, 1970 was a year of some sluggishness in the Canadian economy and the level of imports tended to reflect this situation. The strike in the automobile industry was another factor which reduced the level of imports more sharply than that of exports. In addition, the appreciation of the Canadian dollar following its floating in June of that year further tended to reduce the value of imports. Thus in 1970 the trade balance, partly because of these special reasons, reached the highest level on record at \$3,048 million. The deterioration in the 1971 current account balance resulted from economic slowdowns in some of Canada's overseas markets which adversely affected Canadian exports and from the boom in merchandise imports, especially from the United States and Japan, reflecting the increase in economic tempo in Canada.

There was a moderate increase of 6% in merchandise exports to \$17,929 million while imports, following a 1% decline in 1970, surged by over 12% to \$15,532 million. There were gains in trade of motor vehicles, engines and parts as exports expanded by 19% while imports jumped by 28% to produce an automotive trade surplus (adjusted for balance of payments purposes) of about \$112 million, down from about \$313 million in the preceding year. Sales of lumber, wheat, crude petroleum, rapeseed, barley and natural gas also recorded healthy increases, while exports of copper, fabricated nickel, iron ore and aircraft, engines and parts declined. On the imports side, crude petroleum, communication equipment, tractors, fabricated iron and steel, office machinery, electrical equipment, excavating machinery, wearing apparel, fabrics and synthetic yarn showed notable increases while aircraft, engines and parts, inorganic chemicals, metal working machinery and other types of industrial machinery recorded decreases.

Receipts and payments on non-merchandise transactions, excluding withholding taxes, both rose moderately with receipts at \$4,914 million expanding by one half of a percentage point more than payments which went up to \$6,910 million.

Interest and dividends received in 1971 totalled \$557 million. Nearly all of the moderate increase over 1970 was accounted for by a rise in earnings on official holdings of foreign exchange which in 1971 continued to be the major component in the interest receipts item. Total interest and dividends paid in 1971 were \$1,628 million. Reflecting mostly new issues of

Selected indicators—seasonally adjusted

provincial government bonds and new issues of corporate bonds placed in the United States, payments of interest on funded debt rose to \$783 million. Irregularly large dividends in the fourth quarter of 1971 caused an annual increase of \$39 million over 1970, despite a significant decline in profit remittances of unincorporated Canadian branches of US corporations and smaller disbursements of dividends of Canadian publicly listed companies.

Receipts for travel and freight and shipping both rose by approximately 5%. Travel receipts neared the \$1,300 million mark while receipts on freight and shipping, buoyed somewhat by the longshoremen strike in the United States, amounted to \$1,184 million. On the other hand, other service receipts declined to \$1,340 million due to lower receipts from foreign governments and a reduction in miscellaneous income.

With the United States the current account deficit remained relatively unchanged at \$193 million during 1971 (Table 21.31). On merchandise trade the surplus increased by \$58 million to \$1,192 million following approximately 10% increases in both exports and imports over the previous year. With the raising of the US import quotas, sales of crude petroleum increased. Exports of natural gas also rose and shipments of lumber surged ahead with the boom in residential construction in the United States. More motor vehicles, engines and parts and aluminum were also exported while there was a decrease in deliveries of iron ore and nickel. On the imports side, motor vehicles, engines and parts led the way with a 25% increase. More agricultural machinery, communication and office equipment were imported while purchases of aircraft, engines and parts fell sharply.

The current account surplus with the United Kingdom dropped by 30% to \$502 million resulting largely from a decline in the commodity trade surplus to \$568 million. Merchandise exports at \$1,400 million were down from the previous year, while imports advanced by 13% to \$832 million. All of the service and transfer items except other service transactions contributed to the increase in the non-merchandise deficit to \$66 million.

21.4.2 Capital movements

Capital movements between Canada and other countries in 1971 produced a net inflow of \$376 million, a decrease of \$72 million from 1970. Inflows of capital in long-term forms declined \$348 million from 1970 levels to \$394 million while short-term capital movements led to an outflow of \$18 million, a change of \$276 million from a 1970 net outflow. The net capital inflow, together with a current account surplus of \$401 million and a \$119 million allocation of Special Drawing Rights, produced an increase in Canada's net official monetary assets of \$896 million.

Direct investment. Initial estimates indicate that, for the year 1971, the direct investment net inflow amounted to \$885 million and resulted in the largest net inflow ever recorded. US investors contributed about 68% of the total and directed the largest part of this capital to the petroleum and natural gas and the mining industries. In contrast, the bulk of the net inflows of capital from continental Europe and Japan was for the manufacturing sector of the economy.

The net capital outflow for Canadian direct investment abroad during 1971 amounted to \$305 million, about 60% of it directed to the United States, 19% to the United Kingdom and continental Europe, and the remainder approximately equally divided between the rest of the sterling area and all other countries. By far the largest part of the net outflows originated with the mining sector although the petroleum and natural gas and the transportation sectors contributed significant amounts.

Security transactions. Portfolio transactions during 1971 gave rise to net inflows of \$311 million, marking a continuation of the decline in 1970 to \$565 million from the 1969 level of \$1,806 million. Inflows from sales of new Canadian issues abroad at \$1,162 million were down from already low 1970 inflows of \$1,227 million, while retirements for 1971 of \$804 million were at record high levels. This combination of moderate foreign sales of new issues and high security retirements gave effect to the lowest net new financing from abroad since 1962. Trade in outstanding Canadian securities also contributed to the decline in portfolio inflows with a \$54 million increase in net outflows to \$238 million from \$184 million in 1970. Transactions in foreign securities, however, gave rise to substantially increased net inflows as Canadians reduced their holdings of outstanding foreign securities by \$244 million, an increase of \$146 million from net sales in 1970 of \$98 million. This inflow was offset to some extent by an increase in sales in Canada of new foreign securities to \$63 million from \$34 million in 1970, while retirements of foreign securities held by Canadians were estimated at \$10 million.

Long-term interest rate differentials between Canada and other countries, which had narrowed during 1970 from 1969 levels, continued to offer little incentive to Canadian borrowers to increase offerings abroad. Consequently, although total issues of Canadian funded debt and equities increased slightly during 1971, sales to non-residents at \$1,162 million were moderately lower than during 1970. This reduction, which is more noticeable in terms of offerings during 1971, was in line with the general policy of the Government of Canada to discourage increases in long-term borrowing abroad, and the mix of sales suggests that increased use of foreign markets occurred mainly to retain credit lines and in situations where the Canadian market could not readily absorb the issue. Corporate borrowings abroad declined \$177 million during 1971 to \$363 million. Sales of new provincial direct and guaranteed issues to non-residents increased by \$197 million to \$724 million, while new issues of municipal bonds placed abroad were \$38 million lower, at \$26 million, than during 1970 when there were large issues sold to non-residents during the first and second quarters. Retirements of Canadian securities held abroad at \$804 million were \$252 million higher than during 1970. The high retirement rate can be attributed to a heavy maturity schedule for provincial bonds held by non-residents during the second quarter and to a relatively high rate of early retirements during the second and fourth quarters. An additional outflow was incurred during the fourth quarter as a result of the settlement of Atlantic Acceptance Corporation long-term notes.

Other capital flows in long-term forms. Assistance abroad by the Canadian government consists largely of payments of regular assessments by the international organizations of which Canada is a member, official contributions, intergovernmental loans, subscriptions to the capital of investment agencies and the extension of export credits. Both assessments and contributions form a part of Canada's payments on current account, while other transactions, to the extent that they give rise to claims on non-residents, are reflected mainly in capital movements in long-term forms.

Disbursements on intergovernmental loans extended by Canada increased markedly by \$27 million to a total of \$139 million for the year. Commonwealth countries accounted for over 80% of the total.

Loans and subscriptions to international agencies in 1971 amounted to \$53 million, an increase of \$21 million over the previous year. The International Development Association accounted for \$50 million of the total which was paid in the form of non-negotiable non-interest-bearing Canadian dollar demand notes. Changes in such Canadian obligations to the IDA and to the Caribbean Development Bank are reflected in the capital account covering Government of Canada demand liabilities.

During the year Canada received repayments of \$36 million in principal on intergovernmental loans extended earlier. Receipts of \$20 million, \$9 million, \$5 million and \$2 million came from the United Kingdom, France, the Netherlands and Belgium, respectively. In addition to the payments of principal, there were receipts of \$24 million during 1971 on account of interest. These receipts form part of the current account item comprising Canada's receipts of interest and dividends.

Receipts from the United States associated with the Columbia River Treaty amounted to \$24 million representing the last maturity of the medium-term non-marketable US government securities acquired in connection with the Treaty arrangements.

Capital movements in short-term forms (apart from changes in net official monetary assets) led to a net capital outflow of \$18 million, a change of \$276 million from a 1970 outflow.

Canadian dollar deposits of non-residents rose by \$92 million over the year. Residents of the United States, the United Kingdom and other countries increased their holdings by \$22 million, \$9 million and \$61 million, respectively.

Changes in Canadian holdings of foreign currency bank balances and other short-term funds abroad led to a net capital inflow of \$874 million compared with an outflow of \$424 million in the preceding year. A very large net inflow from the United States of \$1,686 million was somewhat offset by net outflows to the United Kingdom and other countries of \$232 million and \$585 million, respectively. These movements are consistent with changes in hedged interest rate differentials between Canada and the United States and Europe. Canadian holdings of swapped deposits dropped considerably by \$951 million to an end-of-the-year level of \$732 million. Net inflows through the chartered banks were partially offset by net outflows to build up balances held directly abroad by Canadians in foreign banks.

In general the large sales of Canadian money market paper abroad which occurred during the latter part of 1970 did not continue into the first quarter of 1971 and substantial net outflows during the first half of 1971 resulted. The total volume of trading with non-residents was somewhat lower than during 1970. This may have reflected generally lower covered interest rate differentials between Canada and the United States (substantially the largest market for these instruments) as well as the extension in the second quarter of withholding tax to discounted notes redeemed prior to maturity.

21.4.3 International monetary assets and liabilities

Canada's net official monetary assets totalled US\$5,570 million at December 31, 1971, an increase of US\$891 million over the year. The increase in reserves of US\$578 million in the fourth quarter was the largest since the second quarter of 1970 when the Minister of Finance announced that the Canadian dollar would no longer be pegged to within 1% of its par value of 92½ US cents. The increase in Canada's official holdings of US dollars resulted on balance from purchases of foreign exchange in the last quarter of the year when an unusual degree of uncertainty existed in the exchange markets.

Holdings of US dollars increased by a near record amount of US\$1,039 million in the year. Over three quarters of the increase occurred in the last five months of the year following the introduction of new economic policy measures by the United States on August 15. Holdings of other convertible currencies declined by US\$1 million to US\$13 million at the end of the year. There were, however, relatively large variations in holdings during the year with a peak in May equivalent to US\$18 million.

Canada's holdings of Special Drawing Rights (SDRs) totalled US\$372 million at year-end, an increase of US\$190 million in the year. Of this increase, US\$118 million was due to Canada's acceptance of its second allocation of SDRs on January 1, 1971. An increase of slightly over US\$1 million was recorded for monetary gold during the year to yield a total of US\$792 million at the end of the year.

The total of the above transactions led to an over-all increase in Canada's net official monetary assets during the year expressed in Canadian dollars of \$896 million. The Canadian dollar in relation to the US dollar experienced very small fluctuations during the first part of the year until June when it fell sharply by over 1% to a low for the year of 102.53 cents for US\$1.00. Subsequently, the Canadian dollar rose steadily to a high of 99.31 cents in late December.

21.4.4 Analysis of 1972 flows

As Table 21.32 shows, Canada recorded a current account deficit of \$579 million in 1972, a swing of almost \$1,000 million from the 1971 surplus of about \$400 million. Almost all of the change resulted from a decline of \$900 million in the merchandise trade surplus to \$1,497 million. The largest quarterly current account deficits in the year, on a seasonally adjusted basis, were recorded in the first and third quarters when the merchandise trade surpluses were at their lowest.

Buoyant economic activity in Canada, particularly in the latter part of the year, encouraged the growth of imports which, over the year as a whole, rose about 60% faster than exports. A relatively low rate of growth in exports to overseas countries probably reflected a slower pick-up in economic growth in many of these countries than in Canada, especially in the early part of the year.

Total current receipts and payments each surpassed the \$25,000 million mark, registering gains of 10% and 14%, respectively. The difference in rates of growth of exports and imports was probably influenced by strikes in Canada and overseas. In Canada there were dock strikes in the St. Lawrence ports and on the west coast in the second and third quarters, respectively. A seamen's strike in Japan in the second quarter and a dock strike in the United Kingdom in the third quarter also interrupted trade flows.

During 1972 Canada's balance on current transactions weakened with each of the five main areas. With merchandise imports registering marked increases and exports growing at a lower rate or decreasing to some overseas markets the trade balances with all regions declined.

Capital movements led to a net inflow of \$795 million in 1972, more than double the previous year's total. Inflows of capital in long-term forms rose sharply to \$1,773 million from \$394 million in 1971. The main features of this increase were a greater reliance on foreign financing for their bond issues by the provinces and municipalities and a swing to net sales of outstanding Canadian pay bonds, particularly government issues. Lower interest rates,

especially for German mark and Swiss franc issues, encouraged the placement of new issues abroad. Factors accounting for the net sales of outstanding Canadian issues to non-residents were the attractive yields in Canada and their exemption from withholding tax. Augmenting the net inflow were a reduction in outflows resulting from the retirement of Canadian securities held by non-residents and an increase in their miscellaneous long-term investment in Canada.

Short-term capital movements in 1972 led to a net capital outflow of \$978 million, up by \$960 million from the 1971 level. Changes in these accounts were undoubtedly influenced by interest rate differentials on a hedged and unhedged basis between Canada and the United States and Canada and Europe. The international currency markets at the beginning of 1972 did not react very positively to the Smithsonian exchange rate realignments of December 1971. Waves of speculative activity in the foreign exchange markets of the world were common during the year although conditions in Canada were relatively stable. In June the pound sterling was floated while in other countries capital controls were increased to try to insulate currencies from speculative attacks. The demand for Eurodollars, which could be exchanged into a currency which might be revalued upward, raised Eurodollar interest rates to levels which were often attractive to Canadian investors. In Canada, action was taken which reduced the attractiveness of some Canadian money market instruments to foreign investors through an agreement in early June between the chartered banks, concurred in by the Minister of Finance, by which the banks lowered their interest rates on various types of deposits, including deposit notes.

Canada's net official monetary assets totalled US\$6,050 million at December 31, 1972, an increase of US\$480 million in the year. Of this change, US\$134 million occurred as a result of the revaluation of the stock of Canada's gold-based assets in May. These assets include gold, Special Drawing Rights and Canada's reserve position in the International Monetary Fund. Reserves therefore rose by US\$346 million (\$333 million expressed in Canadian dollars) apart from the revaluation of existing holdings.

21.5 International investment

Canada has been among the world's largest importers of capital. Up to 1970 the demand for real resources from abroad, associated with the high rate of growth of the Canadian economy, to a great degree encouraged investments of non-resident capital. The current account deficit produced by the importation of real resources and the rapidly expanding financial needs of the corporate and government sectors of the economy was paralleled by the inflow of capital from abroad. While actual capital inflows have been the principal component of Canada's increasing foreign indebtedness, the unrepatriated earnings of foreign owned branches and subsidiaries are also a significant factor. The very substantial capital formation, which was a feature particularly since the 1950s, was therefore associated with an unprecedented growth in the country's external liabilities. These investments contributed to a rapid rate of growth in the Canadian economy, particularly in the exploitation of natural resources, and added significantly to Canadian production, employment and income. At the same time they added substantially to the continuing burden of Canada's external debt and to the proportion of Canadian industry controlled by non-residents.

21.5.1 Balance of international indebtedness

The balance of international indebtedness is a phrase generally accepted in balance of payments terminology to include equity investments as well as contractual borrowings (Table 21.33). By the end of 1970 Canada's balance of international indebtedness had reached a book value of over \$28,900 million. Canada's total external liabilities in that year were about \$50,000 million of which some \$46,500 million was in the form of long-term claims. On the asset side, the total outflow of domestic long-term capital together with the increase in earnings accrued to Canadians abroad caused the total book value of Canadian long-term investment abroad to rise to about \$11,200 million. Due mainly to a significant increase in official holdings of foreign exchange, total Canadian assets abroad rose by about \$2,400 million to more than \$21,000 million at the end of 1970.

21.5.2 External liabilities

The latest year for which complete data are available is 1969. At the end of that year, Canada's gross external liabilities amounted to \$47,200 million with non-resident owned long-term investments in Canada reaching a book value of \$41,700 million (Table 21.34). Of

this amount some \$24,500 million was in the form of direct investment in Canadian enterprises. Investments in other Canadian equities, although smaller, were also substantial and there were periods in recent years of sharp increases in foreign holdings of Canadian bonds and debentures.

Dependence on external sources of capital for financing in periods of heavy investment activity has been characteristic of Canadian development. During the exceptional growth that occurred before World War I, non-resident investment was very high and the main source of that investment was London. However, during the first part of the interwar period, the United States became the principal source of external capital and by 1926 the portion of Canada's international debt owned in the US exceeded that owned in the United Kingdom. With some interruption during the 1930s US investment in Canada continued to increase, particularly after 1947 when the period of intense activity in the petroleum industry got under way. At \$33,031 million, US long-term investments in 1969 represented about 80% of all non-resident long-term investment in Canada, the main rise occurring in direct investment in companies controlled in the United States.

United Kingdom long-term investments in Canada totalled \$3,862 million at the end of 1969. As a proportion of total non-resident investments in Canada the British share was about 9%, well below their 36% share at the end of 1939 before the wartime repatriations. After reaching a low point in 1948, the value of UK investments in Canada increased each year to 1962, declined slightly in 1963, partly as a result of Canadian repatriation of investments in railways and further provincial takeover of other utilities, then increased again in subsequent years.

Long-term investments of countries other than the United States and the United Kingdom rose dramatically to \$4,775 million at the end of 1969. More than two and one half times larger than a decade earlier, long-term investment from this source continued to grow at a rate in excess of that of either the US or UK. It represented over 11% of total foreign long-term investment in Canada in 1969 as compared to just under 10% in 1968. Of the \$2,056 million direct investment in 1969 by all other countries, about 83% originated in Europe, primarily the Netherlands and France. Swiss direct investment showed the largest relative increase in this group for 1969.

In trying to assess the impact of foreign investment on the Canadian economy it is useful to consider not only the absolute dollar value but also the degree to which our industries have become subject to foreign control. The most recent comprehensive calculation of the ratios of non-resident ownership in Canadian manufacturing, mining and petroleum is for the year 1967. In that year the Canadian manufacturing industry was 52% owned by non-residents but capital subject to foreign control was 57%. These proportions compared with 50% and 56%, respectively, as recently as the end of 1957. In the field of petroleum and natural gas, non-resident ownership and control amounted to 62% and 74%, respectively, at the end of 1967, whereas at the end of 1957 non-resident ownership and control had amounted to 63% and 76%, respectively; in mining and smelting, non-resident ownership and control amounted to 61% and 65%, respectively, compared with 56% and 61% in 1957.

Canadian owned capital continued to play a leading role in the financing of several areas of business such as merchandising, railways and other public utilities. Thus, taking a broader range of business activity including manufacturing, petroleum, mining, merchandising and all utilities, non-resident ownership rose only slightly from 32% in 1948 to 35% in 1967. However, the importance of direct investment as a vehicle for foreign investment was evident in the fact that the share of capital invested in Canadian industries that was subject to foreign control jumped from 25% in 1948 to 35% in 1967.

21.5.3 Canadian assets abroad

Although there has been considerable growth in non-resident investment in Canada and in the balance of Canadian indebtedness to other countries, it will be noted that Canadian assets abroad (Tables 21.33 and 21.35) have continued to rise in value. These now equal a larger proportion of liabilities abroad than was the case before World War II. As a proportion of Canada's liabilities they rose from about one fifth in 1926 to about two fifths in 1970. This development was accompanied by a change in the structure of Canada's assets. The share of private long-term investment in Canada's assets declined from about 70% of the total in 1926 to about 45% in 1970. Assets abroad of the Government of Canada which were minor in 1926 accounted for nearly one third of the total in 1970. In fact, in the period immediately after World War II, the government proportion of Canada's foreign assets was even higher and in

some years accounted for as much as two thirds of the total. Various short-term holdings other than net official monetary assets accounted for the balance of Canada's foreign assets. Their share of total assets has varied over the years; from about a third of the total in 1926, the proportion became negligible by the end of World War II. In recent years they comprised about a fifth of the total. Long-term assets, both private and government, have tended to be greater than short-term assets over the years.

Canadian long-term investment abroad has increased over twelvefold from \$926 million in 1926 to \$11,401 million in 1970. The bulk of Canadian long-term investment abroad is in private investment, especially direct investment. The remainder is mostly in government loans and advances and subscriptions to international investment agencies.

Geographically, long-term investment in the United States of \$5,631 million made up slightly less than half of Canada's long-term investment abroad in 1970. About three fifths of total private investment was in that country. Outstanding Government of Canada credit provided under authority of the United Kingdom Financial Agreement Act, 1946, as subsequently amended in 1957, was the major element in the \$1,739 million of Canadian assets in the UK. In the decade of the 1960s the share of direct investment in Canada's assets in the UK increased to account for over a third of the total. In other Commonwealth countries, direct investment has always been the predominant form of Canada's assets. Although at the end of 1970 direct investment accounted for about three quarters of Canada's assets in these countries, its share was somewhat lower than in most of the previous years due to the expansion of Government of Canada credits made under the new development or "soft" loan program. In the 1960s direct investment emerged as the most important form of Canada's assets in all other countries and accounted for over one half of the total in those countries. Export credits made directly or indirectly at risk of the Government of Canada also continued to be an important element in Canada's assets in all other countries.

Canadian short-term assets, consisting of net official monetary assets, other Canadian short-term holdings of exchange and short-term receivables, have increased more than fourfold since the end of World War II to account for over two fifths of total assets in 1970.

21.6 Financial flow accounts

The financial flow accounts, introduced in 1969, provide a detailed exposition of financial activity in the Canadian economy within an integrated macro-economic accounting system. Financial transactions of the various sectors of the economy are brought into explicit statistical relationship with one another while the structure of the system provides a direct linking of financial data to production statistics in each sector of the economy. The presentation of financial statistics for the whole economy allows developments in any sector to be viewed in relation to other sectors or in relation to the entire economy. The simultaneous linking of financial and production statistics provides a statistical framework appropriate to investigation of the interrelationships of financial markets and markets for goods and services. The presentation of financial and production statistics within the framework of a balancing set of accounts has the additional benefit of exposing gaps in statistical coverage and providing a quality check on existing statistics.

The financial flow accounts focus on the sectors of the economy associated with the income and expenditure accounts (i.e., personal, business, government and foreign sectors) but provide a considerably more detailed articulation. The system describes 41 sectors and subsectors, more than half of which are devoted to the various types of financial institutions. Sector financial transactions are described in terms of 50 categories of financial assets and liabilities such as loans, bonds and mortgages. The balancing and internal consistency of the system is based on two important identity relationships. First, for the total economy, saving and investment are equal and changes in financial assets are equal to changes in financial liabilities. Secondly, in every sector, the excess of investment over saving or vice versa must be matched by offsetting changes in financial assets and/or financial liabilities. The first relationship ensures a balanced system while the second relationship ensures internal consistency.

Basically, what the accounts do is show the saving available from current revenue less current expenditure for each sector; non-financial capital formation undertaken by the sector is charged against the saving, leaving the net lending or borrowing requirements of each sector; the means by which funds flow between borrowing and lending sectors are shown by the presentation of net changes in the liabilities and assets of each sector. These changes are

frequently referred to as the source and use of funds respectively. The system reveals the important role of financial institutions in providing the link between borrowers and lenders by accepting deposits, for example, which may be highly liquid and yield low interest rates to the depositor. These funds deposited with a financial institution are in turn re-loaned in the form of loans with quite different liquidity and yield characteristics.

Financial activity in Canada in 1972 continued to expand to meet the strong demand for funds generated by the second full year of economic recovery. In particular, credit markets were able to satisfy the needs created by the continuing, very strong, growth of residential construction and the sharp surge on consumer spending which rose more rapidly than in any year since 1955. Demand for business financing was somewhat lower as increased cash flow resulting from an impressive rise in profits permitted business to satisfy more of its needs from internal sources. There was a considerable shift in the pattern of borrowing, however, as more attractive interest rates on bank loans drew business away from more traditional sources of funds. Plant and equipment expenditures and inventory accumulation by business were only moderately higher in 1972. Expenditures on machinery and equipment increased sharply but non-residential construction was little changed. Similarly, according to preliminary estimates, a strong growth in inventories in the first quarter was not maintained during the rest of the year.

The main thrust of the expansionary monetary and fiscal policy in 1972 was again directed toward the reduction of the considerable slack remaining in the economy. Unemployment persisted at unacceptably high levels throughout the year as the largest employment gains since 1969 were virtually offset by almost equally large increases in the labour force.

International currency markets continued to be plagued by considerable instability despite the major realignment of currencies resulting from the Smithsonian Agreement of December 1971. Conditions in Canada, however, were relatively stable although higher short-term interest rates in Canada attracted large short-term capital inflows in early summer, as residents converted substantial amounts of their foreign currency holdings. The threatened appreciation of the Canadian dollar was obviously incompatible with the principal objectives of monetary and fiscal policy. However, short-term rates declined sharply following the so-called Winnipeg Agreement in June when the chartered banks, with the concurrence of the Minister of Finance, agreed to limit interest rates on large deposits to 5½%. Keen competition between the banks to attract deposits to accommodate the demand for business loans had been largely responsible for the escalation of short-term interest rates during the first half of the year. By the end of the year short-term interest rates were only moderately higher than those at the end of 1971.

Long-term interest rates followed a similar course in 1972 although mid-year increases were by no means as pronounced as for short-term rates. Lower interest rates abroad, especially for German mark and Swiss franc issues, encouraged provincial and municipal governments to resume their long-term borrowing abroad on a fairly substantial scale.

The liquidity of the chartered banks fell to a new low in 1972 in line with the policy of close control adopted by the Bank of Canada in the summer of 1971. Despite further substantial inflows of deposits in 1972, the banks were obliged to reduce their holdings of more liquid assets, particularly of federal bonds, in order to meet the very strong demand for loan and mortgage funds.

Broadly defined money supply (currency and privately held Canadian dollar deposits) grew by 16% over the year, or at about the same rate as in 1971. During the first half of the year a rate of increase of 25% was recorded. However, following the restructuring of interest rates between banks and non-banks in late June there was a run down of non-personal term and notice deposits and the rate of increase slowed to 8%. Money supply, narrowly defined, in contrast, expanded sharply (at an annual rate of 19%) after averaging an annual growth rate of 7% in the first half of the year. Much of the increase in the latter part of the year occurred with the unusually large upswing in demand deposits in August.

The volume of credit market borrowing rose by a further 9% to \$17,274 million compared with the already high \$15,883 million of 1971. For both years this was equivalent to 17% of gross national product, indicating a continuing high rate of financial activity. Very strong increases were recorded in borrowing through bank loans, consumer credit and mortgages over the already high levels registered for 1971. Net sales of other bond issues, stocks and commercial paper, however, were sharply down.

The sources of credit market lending remained broadly the same as in 1971 although financial institutions other than the chartered banks grew somewhat more rapidly than the chartered banks themselves, increasing their net new lending to \$5,587 million compared with \$4,666 million in 1971. The chartered banks provided about the same substantial amount of financing as in 1971 as did public financial institutions. The rest of the world sector increased its net lending to \$1,587 million from \$223 million in 1971. To a large extent, this was associated with the resumption of large sales abroad of new provincial and municipal bond issues. Funds provided by "other domestic sectors", on the other hand, were sharply lower in 1972 reflecting, in part, a marked decrease in purchases of Canada Savings Bonds following the record levels of 1971. The series for "other domestic sectors" is dominated by personal sector data and should be interpreted with caution on this account. Personal sector data are produced largely by residual estimating techniques which may be subject to considerable error.

A summary matrix of the financial flow system is presented in Table 21.36. More detailed quarterly data for individual sectors and summary matrices are available.

¹ Families of two or more persons.

² Radio and television receiving sets, record players and tape recorders.

21.22 Gross weighted industry selling price index (manufacturing)¹, 1962-72 (1961 = 100)

Year	Index	Year	Index	Year	Index
1962	101.1	1966	107.7	1970	119.1
1963	102.5	1967	109.8	1971	121.6
1964	103.3	1968	112.1	1972	127.4 ^d
1965	104.7	1969	116.3		

¹ The index measures the movements of prices of gross shipments of manufacturing industries, including inter-industry shipments between individual industries within manufacturing. Therefore, it duplicates the movements of some prices in the sense that, for example, flour prices are given full weight as part of the shipments of the flour mills industry and then are implicitly counted again through full weighting of the shipment prices of those manufacturing industries which use flour as an ingredient in their outputs, e.g., bread, biscuits, cakes, etc.

21.23 General wholesale index annual averages, 1949-72 (1935-39 = 100)

Year	Average	Year	Average	Year	Average	Year	Average
1949	198.3	1955	218.9	1961	233.3	1967	264.1

¹ Includes equity of non-residents in assets abroad of Canadian companies but excludes investment of insurance companies and banks (held mainly against liabilities to non-residents).

² Negative amounts arise from the application of reserves against government inactive assets and short positions of Canadian financial institutions.

³ Medium-term non-marketable United States government securities acquired under the Columbia River Treaty arrangements are shown from 1964.

⁴ Includes deferred interest on the United Kingdom 1946 loan agreement starting from 1956 and amounting to \$101 million in 1970.

⁵ Includes investment in Newfoundland prior to 1949.

⁶ Includes United Nations bonds from 1962, which amounted to \$5 million in 1970.

Appendix 1

Functions of government organizations and related agencies

A summary organization chart of the federal government appears in Chapter 4. A detailed chart is available from Information Canada.

Agricultural Products Board. The Agricultural Products Board was established under authority of the Emergency Powers Act by Order in Council PC 3415 of July 31, 1951, to administer contracts with other countries to buy, or sell, agricultural products, and to carry out other commodity operations as considered necessary or desirable as determined by Canada's needs and requirements. The Board was re-established under the Agricultural Products Board Act in 1952 and operates now under RSC 1970, c.A-5.

The Board is a part of the Canada Department of Agriculture.

Agricultural Stabilization Board. Established in 1958 as a Crown corporation under the Agricultural Stabilization Act (RSC 1970, c.A-9), the Board is empowered to stabilize prices of agricultural products both to assist the industry in realizing fair returns for labour and investment and to maintain a fair relationship between the prices received by farmers and the costs of goods and services that they buy. Programs under the Act are administered by Board staff with assistance from the Canada Department of Agriculture. The Board reports to Parliament through the Minister of Agriculture.

Air Canada. Formerly Trans-Canada Air Lines, Air Canada was incorporated by Act of Parliament in 1937 (RSC 1970, c.A-11) to provide a publicly owned air transportation service, with powers to carry on its business throughout Canada and outside Canada. The corporation now maintains passenger, mail and commodity traffic services over nation-wide routes as well as services to the United States, Britain, Ireland, Belgium, France, Switzerland, the Federal Republic of Germany, Austria, Denmark, the USSR, Czechoslovakia, Bermuda, the Bahamas, Jamaica, Antigua, Barbados and Trinidad. Air Canada is responsible to Parliament through the Minister of Transport.

Anti-dumping Tribunal. Under the Anti-dumping Act (RSC 1970, c.A-15, as amended by SC 1970-71, c.3), the Anti-dumping Tribunal is declared to be a court of record and makes formal inquiry into the impact of dumping on production in Canada. Within 90 days of a preliminary determination of dumping by the Deputy Minister of National Revenue for Customs and Excise, the Tribunal must make an order or finding on the question of injury, threat of injury or material retardation to production in Canada of like goods. Decisions of the Tribunal are final and conclusive except as provided for under Section 28 of the Federal Court Act (SC 1970, c.1). In addition, the Governor in Council may request the Tribunal to investigate and report on any matter relative to the importation of goods into Canada that may cause or threaten injury to the production of any goods in this country.

The Tribunal consists of a chairman and not more than four other members. Its offices are located in Ottawa and it may conduct hearings in other centres in Canada. The Tribunal reports to Parliament through the Minister of Finance.

Army Benevolent Fund Board. The Army Benevolent Fund Board, established by the Army Benevolent Fund Act (RSC 1970, c.A-16), administers the Army Benevolent Fund, a special account set up in the Consolidated Revenue Fund. The Board awards grants from the special account to veterans or their dependants for relief, if none is available from government sources, and for educational assistance, contingent on need and continued progress. The Board has five members appointed by the Governor in Council, one of whom is nominated by the Royal Canadian Legion and one by the National Council of Veterans Associations in Canada. Head office is in Ottawa. The Board reports to Parliament through the Minister of Veterans Affairs.

Atlantic Development Council. Created under the 1969 Government Organization Act (SC 1968/69, c.28), the Atlantic Development Council is composed of 11 members representative of the area appointed by the Governor in Council to advise the Minister of Regional Economic Expansion on plans and policies for economic expansion and social adjustment in the Atlantic Provinces, and to carry out feasibility studies and evaluate policies or programs submitted within the framework of an over-all strategy for the development of the region.

The Council reports to Parliament through the Minister of Regional Economic Expansion.

Atomic Energy Control Board. By Act of Parliament (RSC 1970, c.A-19) proclaimed October 1946, the regulation and control of atomic energy in Canada was placed under the Atomic Energy Control Board. The Board reports to Parliament through the Minister of Energy, Mines and Resources.

Atomic Energy of Canada Limited. This Crown company was incorporated in February 1952 under the Atomic Energy Control Act, 1946 (RSC 1970, c.A-19) to take over from the National Research Council on April 1, 1952 the operation of the Chalk River project. The main activities of the company are: the development of economic nuclear power; scientific research and development in the atomic energy field;

the operation of nuclear reactors; and the production of radioactive isotopes and associated equipment such as cobalt-60 beam therapy units for the treatment of cancer. The company reports to Parliament through the Minister of Energy, Mines and Resources.

Bank of Canada. Legislation of 1934 (RSC 1970, c.B-2) provided for the establishment of a central bank in Canada to regulate credit and currency, to control and protect the external value of the Canadian dollar and to stabilize the level of production, trade, prices and employment as far as may be possible within the scope of monetary action. The Bank acts as the fiscal agent of the Government of Canada, manages the public debt and has the sole right to issue notes for circulation in Canada. It is managed by a board of directors appointed by the government and composed of a governor, a deputy governor and 12 directors; the Deputy Minister of Finance is also a member of the board. The Bank reports to Parliament through the Minister of Finance.

Bilingual Districts Advisory Board. The Official Languages Act (RSC 1970, c.O-2) requires the creation of federal bilingual districts, in which federal services will be provided in English and French. For a territory to be declared a bilingual district, the two official languages must be spoken by residents of the area and at least 10% of the total population must speak a mother tongue which is the official language of the linguistic minority within the area. An area may be considered a federal bilingual district, even if it does not reach the required percentage, if federal services were already available in both official languages before the Act came into force. To determine the boundaries of these districts, the Act requires the federal government to set up an Advisory Board of five to ten members, representing the several provinces or regions of Canada. The Board must be constituted as soon as possible after each decennial census and makes recommendations to the Cabinet based on census statistics. Its report is submitted to the Governor in Council who presents it to Parliament through the Secretary of State.

Blue Water Bridge Authority. The Bridge Authority was created by the Blue Water Bridge Authority Act (SC 1964, c.6). It is responsible for the operation of the Canadian portion of the bridge spanning the St. Clair River from Point Edward, Ont. to Port Huron, Mich. and has wide powers to perform all things necessary for not only the present bridge but for any future bridge at this site. It may acquire that portion of the bridge and its approaches etc., as may be granted by Her Majesty in right of Canada and the appropriate authority in the United States. Tolls set are subject to the approval of the Canadian Transport Commission. The Authority is a non-profit organization and all toll moneys must be used for the operation and maintenance of the present bridge or for the building of a new one. It is not an agent of the Crown but members of the Authority are appointed by the Governor in Council on the recommendation of the Minister of Transport with terms of office ranging from one to four years.

Board of Examiners for Dominion Land Surveyors. Established under the Canada Lands Survey Act (RSC 1952, c.26), the Board examines candidates: for admission as articulated pupils; for commissions as Dominion Land Surveyors; or for certificates as Dominion Topographical Surveyors. It is also responsible for the discipline of Dominion Land Surveyors. The Board has three members appointed by the Governor in Council, one of whom, the chairman, is the Surveyor General of Canada; it is part of the Department of Energy, Mines and Resources.

Bureau of Pensions Advocates. The Bureau was established under the Minister of Veterans Affairs by the amendments to the Pension Act 1971 (SC 1970-71, c.31). It is not part of the Department of Veterans Affairs, but provides an independent professional legal aid service to applicants for awards under the Pension Act. The Bureau's head office is in Ottawa; there are district offices in major centres across Canada.

Canada Council. The Council was established by Order in Council dated April 15, 1957, under the terms of the Canada Council Act (RSC 1970, c.C-2) assented to March 28, 1957. It is composed of a chairman, a vice-chairman and 19 other members, a director and an associate director. The function of the Council is to encourage the arts, humanities and social sciences in Canada, mainly through a broad program of fellowships and grants. Its principal sources of income are an annual grant from the government, which amounted to \$26 million for the year ended March 31, 1972 and an Endowment Fund, originally of \$50 million, which has an annual yield of approximately \$5 million. In the making, managing and disposing of investments under the Act, the Council has the advice of an investment committee of five, including the chairman and another member of the Council. The proceedings of the Council are reported each year to Parliament through the Secretary of State.

Canada Deposit Insurance Corporation. The Corporation was established by legislation (RSC 1970, c.C-3), which received Royal Assent on February 17, 1967. It is empowered to insure Canadian currency deposits other than those belonging to the Government of Canada, up to \$20,000 per person, in banks, federally incorporated trust and loan companies that accept deposits from the public, and in similar provincially incorporated institutions that are authorized by their provincial governments to apply for such insurance. The Corporation is also empowered to act as a lender of last resort for member institutions. The board of the Corporation comprises a chairman, appointed by the Governor in Council, and four other directors

who hold the positions of Governor of the Bank of Canada, Deputy Minister of Finance, Superintendent of Insurance and Inspector General of Banks. It reports to Parliament through the Minister of Finance.

Canada Development Corporation. The Corporation was established in 1971 by the Canada Development Corporation Act (SC 1970-71, c. 49). The purpose of the Corporation is to develop and maintain strong Canadian controlled and managed corporations in the private sector of the economy and to give Canadians greater opportunities to invest and participate in the economic development of Canada. Its affairs are administered by a board of 21 directors. The authorized capital of the Corporation consists of 200 million common shares without par value and 1,000 million preferred shares. At the end of 1972, 13.6 million common shares had been issued. During 1972, the Corporation acquired all the shares of Polymer Corporation Limited and Connaught Laboratories Limited and a 36% interest in Venturetek International Limited. The Corporation is also a participant in the Gas-Arctic Northwest Project Study Group. The Corporation is not an agency of the Crown and is not subject to the provisions of the Financial Administration Act.

Canada Emergency Measures Organization. The Canada Emergency Measures Organization was established by Cabinet in June 1957 to assume leadership in the development, in peacetime, of civil plans and arrangements designed to ensure the nation's capability to survive and recover from any national emergency. The Orders in Council PC 1959-656 and PC 1963-993, which originally set out the specific functions of the Organization, were replaced by Order in Council PC 1965-1580. The Organization reports to Parliament through the Minister of National Defence.

Canada Labour Relations Board. Established under authority of the Canada Labour Code (RSC 1970, c.L-1), the Canada Labour Relations Board administers Labour Code provisions concerning the certification of trade unions as bargaining agents and the writing of procedures into collective agreements to settle disputes about the meaning or violation of such agreements. The Board consists of a chairman, a vice-chairman and not more than eight members equally representative of employees and employers, appointed by the Governor in Council to hold office during pleasure. It reports to Parliament through the Minister of Labour.

Canada Manpower and Immigration Council. Operating under RSC 1970, c.C-4, the Canada Manpower and Immigration Council consists of a chairman and not more than 15 members appointed by the Governor in Council. The Council advises the Minister of Manpower and Immigration on all matters pertaining to the effective utilization and development of manpower resources in Canada, including immigrants to Canada and their adjustment to Canadian life.

Canadian Arsenals Limited. The principal function of this Crown corporation is to operate the government-owned facilities for the production of certain defence materiel. It was established under the Companies Act by Letters Patent dated September 20, 1945, and is subject to the Government Companies Operation Act (RSC 1970, c.G-7) and certain provisions of the Financial Administration Act (RSC 1970, c.F-10). It reports to Parliament through the Minister of Supply and Services.

Canadian Broadcasting Corporation. The CBC was established by Act of Parliament in 1936, replacing an earlier public broadcasting agency, the Canadian Radio Broadcasting Commission, created in 1932. The Broadcasting Act of 1968 (RSC 1970, c.B-11) describes the CBC as "established by Parliament for the purpose of providing the national broadcasting service".

The Corporation has a president and 14 other directors appointed by the Governor in Council. The president is the chief executive officer. The executive vice-president is appointed by the Corporation on the recommendation of the president and with the approval of the Governor in Council. He is responsible to the president for the management of broadcasting operations in accordance with policies prescribed by the Corporation.

CBC operations are financed by public funds voted annually by Parliament, with supplementary revenue obtained from commercial advertising. The CBC's accounts are audited annually by the Auditor General of Canada and the Corporation reports to Parliament through the Secretary of State of Canada.

Canadian Commercial Corporation. Established in 1946 by Act of Parliament (RSC 1970, c.C-6), the Canadian Commercial Corporation is wholly owned by the Government of Canada. Initially it assumed the undertaking of the (then) Canadian Export Board covering procurement in Canada of goods and services on behalf of foreign governments and United Nations relief agencies. In 1947 responsibility for procurement of the requirements of the Department of National Defence was transferred from the Department of Reconstruction and Supply to the Corporation which fulfilled these additional functions until the formation of the Department of Defence Production in 1951. In 1963 the staff of the Corporation was integrated with that of the Department of Defence Production, now part of the Department of Supply and Services, which provides all the management and services required by the Corporation.

The Corporation continues to act primarily as the Canadian government contracting and procurement agency on behalf of foreign countries purchasing defence or other supplies and services from Canada on a government-to-government basis. It is also in a position to assist persons in Canada to obtain goods and

commodities from outside Canada and to dispose of goods and commodities that are available for export from Canada. It reports to Parliament through the Minister of Supply and Services.

Canadian Consumer Council. The Council was established in 1968 under RSC 1970, c.C-27 to advise the Minister of Consumer and Corporate Affairs on all facets of consumerism. It meets several times a year, has 19 members representing all segments of the population and all areas of Canada. Although supported financially by the Department of Consumer and Corporate Affairs, it is independent and reports to Parliament through the Minister.

Canadian Council on Rural Development. Created under the Agricultural and Rural Development Act (RSC 1970, c.A-4), the Canadian Council on Rural Development is a 31-member agency established to advise the Minister of Regional Economic Expansion on rural development policies, and to provide a forum for public information and discussion on rural problems and government programs for rural development. It reports to Parliament through the Minister of Regional Economic Expansion.

Canadian Dairy Commission. This Commission, which reports to Parliament through the Minister of Agriculture, was established on December 2, 1966 (RSC 1970, c.C-7) to provide efficient producers of milk and cream with the opportunity of obtaining a fair return for their labour and investment and thus ensure that consumers of dairy products would have a continuous and adequate supply of dairy products of high quality. The Commission consists of three members appointed by the Governor in Council and operates with the advice of a nine-member consultative committee appointed by the Minister.

Canadian Film Development Corporation. This Corporation, established by Act of Parliament in March 1967 (RSC 1970, c.C-8), fosters and promotes the development of a feature film industry in Canada through investment in productions, loans to producers, grants to film-makers and film technicians, awards for outstanding accomplishments, and advice and assistance in distribution and administrative matters. It works in co-operation with other federal departments and agencies and with provincial departments and agencies having like interests and finances its operations from a film development advance account in the Consolidated Revenue Fund. The Corporation consists of the Government Film Commissioner and six other members appointed by the Governor in Council for terms of five years. The Corporation reports to Parliament through the Secretary of State.

Canadian Government Specifications Board. Created in 1934 under the authority of the National Research Council Act (RSC 1970, c.N-14) as the Canadian "Government Purchasing Standards Committee", this interdepartmental agency's name was changed in 1948 to the Canadian Government Specifications Board (CGSB).

In 1965, responsibility for the CGSB's operation was transferred by Order in Council to the Department of Defence Production, now part of the Department of Supply and Services. Membership of the Board was then revised to include the Secretary of the Treasury Board, the President of the National Research Council, and the Deputy Ministers of Consumer and Corporate Affairs, National Defence, Public Works, Supply and Services, Transport, and Industry, Trade and Commerce. The Deputy Minister of Supply was designated Chairman of the Board.

The role of the CGSB has expanded to provide standards in support of government programs in procurement, consumer requirements, legislation, technical practices, test procedures and international standardization in more than a hundred fields, many of which are of national interest. It has compiled more than 1,600 standards which are available in both official languages. The technical process of developing and revising standards is performed by some 300 committees and more than 3,000 competent members representing the interests of government, industry, research and testing agencies, and users. The Board works closely with the Standards Council of Canada.

Canadian Grain Commission. The Canada Grain Act (SC 1970-71, c.7) came into force on April 1, 1971, repealing the Canada Grain Act, 1930 (RSC 1952, c.25) and replacing the former Board of Grain Commissioners for Canada. The new Commission reports to Parliament through the Minister of Agriculture, as did the Board, and the responsibilities are unchanged. The Commission provides general supervision over the physical handling of grain in Canada by licensing elevators and elevator operators, by inspecting, grading and weighing grain received at and shipped from terminal elevators, and by other services associated with regulating the grain industry. It manages and operates the six Canadian government elevators in western Canada.

The Commission consists of a chief commissioner and two commissioners. Its objects are, in the interests of grain producers, to establish and maintain standards of quality for Canadian grain, to ensure a dependable commodity for domestic and export markets and to regulate grain handling in Canada. It has authority to conduct investigations and hold hearings on matters coming within its purview, and to undertake, sponsor and promote research in relation to grain and grain products.

The Commission is part of the Canada Department of Agriculture, but submits a separate report to the Minister.

Canadian International Development Agency. The operation and administration of Canada's programs of international development are the responsibility of the Canadian International Development Agency. Originally established by Order in Council PC 1960-1476 and known until 1968 as the External Aid Office, the Agency is under the direction of a president and a governing board (Canadian International Development Board) and reports to Parliament through the Secretary of State for External Affairs.

Canadian International Development Board. This Board is the governing council responsible for directing operations of the Canadian International Development Agency.

Canadian Livestock Feed Board. This corporation, which reports to Parliament through the Minister of Agriculture, was established pursuant to the Livestock Feed Assistance Act (RSC 1970, c.L-9). The objects of the corporation are to ensure that sufficient feed grain and storage for feed grain are available to meet the needs of livestock feeders and to ensure reasonable stability and fair equalization of feed grain prices in eastern Canada and in British Columbia. Its powers include authority to make payments related to the cost of feed grain storage and transportation costs to attain its objectives. It may also buy, transport, store and sell feed grains in eastern Canada and British Columbia when authorized by the Governor in Council.

The Board has four members and operates with the assistance of a seven-member advisory committee; members of both the Board and the committee are appointed by the Governor in Council.

Canadian National Railways. The Canadian National Railway Company was incorporated to operate and manage a national system of railways, including the Canadian Northern Railway System, the Canadian Government Railways and all lines entrusted to it by Order in Council. Its operations are now governed by RSC 1970, c.C-10. In 1923 the Grand Trunk Railway Company of Canada was amalgamated with the Canadian National Railway Company and since 1923 a number of railway lines acquired by the government have been entrusted to the Company for operation and management, including the Newfoundland Railway and steamship services in 1949, the Témiscouata Railway in 1950, and the Hudson Bay Railway and the Northwest Communication System in 1958. The Canadian National Railways Act, 1919 was repealed in 1955 and the Canadian National Railways Act (SC 1955, c.29) substituted therefor.

The Canadian National Railway Company is controlled by a chairman and board of directors appointed by the Governor in Council, who report to Parliament through the Minister of Transport.

Canadian National Railways Securities Trust. This corporation was created by Section 12 of the Canadian National Railways Capital Revision Act 1937 for the purpose of acquiring and perpetuating the government claims and collateral against the Canadian Northern, the Grand Trunk, the Grand Trunk Pacific and Canadian National Railway companies for loans and accrued interest thereon.

Originally the capital stock was held by the Minister of Finance on behalf of the Crown, and the government transferred its claim to the Trust so that the railways remained obligated to the Trust in the same way and to the same extent they had previously been obligated to the government. Under the Canadian National Railways Capital Revision Act (RSC 1952, c.41) the capital stock was transferred to the Canadian National Railway Company in exchange for shares in that company. The indebtedness of the debtor corporations, however, remained unchanged and the restrictions as to the release of the securities remained under the control of the Governor in Council.

The chairman and directors of the Canadian National Railways are the trustees of the Canadian National Railways Securities Trust which reports to Parliament through the Minister of Transport.

Canadian National (West Indies) Steamships Limited. This agency corporation no longer owns or operates vessels but still reports assets through the Minister of Transport.

Canadian Overseas Telecommunication Corporation (COTC). Created in 1950 by Act of Parliament (RSC 1970, c.C-11), this Crown corporation operates all overseas communications to and from Canada — whether by radio, undersea cable or international satellite. By means of international-gateway switching-centres in Montreal and Vancouver, COTC provides public telephone service to cover 200 overseas territories. The Corporation also provides public message telegraph service, Telex and private wire service to many overseas points. COTC is the designated operating entity for Canadian participation in Intelsat. It reports to Parliament through the Minister of Communications.

Canadian Patents and Development Limited (CPDL). This Crown corporation was set up in 1947 under an amendment to the National Research Council Act passed in 1946. The purpose of the company, which is a subsidiary of the National Research Council, is to patent and license new products and processes that come out of NRC research, research of other government departments and agencies, and research of Canadian universities. Proposals for patents are assessed with regard to originality, existence of similar patented products or processes, commercial appeal, humanitarian or scientific value, and cost of developing, promoting and marketing. CPDL initiates and finances the development of many inventions to a stage where it is economically possible for private industry to carry them through to production and sale, thus bridging the gap between research and industry. Profits from inventions are used to sponsor less profitable but often more beneficial inventions, such as highly specialized surgical or scientific instruments.

The company, whose head office is located in Ottawa, reports to Parliament through a designated Minister, at present the President of the Treasury Board.

Canadian Penitentiary Service. The Penitentiary Service operates under the Penitentiary Act (RSC 1970, c.P-6) and is under the jurisdiction of the Solicitor General of Canada. It is responsible for all federal penitentiaries and for the care and training of persons sentenced or committed to those institutions. The Commissioner of Penitentiaries, under the direction of the Solicitor General, has control and management of the Service and all matters connected therewith.

Canadian Pension Commission. This Commission, established in 1933 by amendments to the Pension Act (RSC 1970, c.P-7), replaced the Board of Pension Commissioners, the first organization created to deal solely with war pensions for service in Canada's Armed Forces. The Commission's main function is the administration of the Pension Act under which it adjudicates on all claims for pensions in respect of disability or death arising out of service in Canada's Armed Forces; and Parts I to X and Part XII of the Civilian War Pensions and Allowances Act, which provide for the payment of pensions in respect of death or disability arising out of civilian service directly related to the prosecution of World War II. It also adjudicates on claims for pension under various other measures, authorizes and pays monetary grants accompanying certain gallantry awards bestowed on members of the Armed Forces, and administers various trust funds established by private individuals for the benefit of veterans and their dependants. The Commission consists of eight to 14 commissioners and up to ten ad hoc commissioners appointed by the Governor in Council. Its chairman has the rank of a Deputy Minister and it reports to Parliament through the Minister of Veterans Affairs.

Canadian Permanent Committee on Geographical Names. This Committee deals with all questions of geographical nomenclature affecting Canada and undertakes research and investigation into the origin and usage of geographical names. Its membership includes representatives of federal mapping agencies and other federal offices concerned with nomenclature and a representative appointed by each province. The Committee is administered by the Department of Energy, Mines and Resources.

Canadian Radio-Television Commission (CRTC). This Commission, established under the provisions of the Broadcasting Act, 1967-68 (RSC 1970, c.B-11), regulates and supervises all aspects of the Canadian broadcasting system. The executive committee, after consultation with the part-time members in attendance at a Commission meeting, may issue broadcasting licences or renewal licences for such terms, not exceeding five years and subject to such conditions related to the circumstances of the licensee as the executive committee deems appropriate for the implementation of the broadcasting policy enunciated in Section 2 of the Broadcasting Act. Under the same circumstances, the executive committee may, on application by a licensee, amend any conditions of a broadcasting licence already issued. The Commission usually holds public hearings in connection with issuing, suspending, etc. licences.

The CRTC consists of five full-time members and ten part-time members chosen regionally and appointed by the Governor in Council. It reports to Parliament through the Minister of Communications.

Canadian Saltfish Corporation. The Canadian Saltfish Corporation was established under the Saltfish Act (SC 1969-70, c.32) and became operative on May 4, 1970. Its main purpose is to improve the earnings of fishermen and of other primary producers of salt-cured fish, through the production or purchase, processing and marketing of salt cod from participating provinces.

The Corporation, whose head office is at St. John's, Nfld., consists of a board of directors composed of a chairman, whose office is in Ottawa, a president who is general manager, one director for each participating province and not more than five other directors, all of whom are appointed by the Governor in Council. It is assisted by an advisory committee of 15 members, also appointed by the Governor in Council, at least half of whom are fishermen or representatives of fishermen. The limit of the Corporation's financial obligations is \$10 million and the Corporation is required to operate without grant appropriation from Parliament. It is empowered to distribute excess of income over expenses to participating fishermen and other primary producers. The Corporation reports to Parliament through a designated Minister, at present the Minister of the Environment.

Canadian Transport Commission. The Canadian Transport Commission, a court of record created in 1967 by the National Transportation Act (RSC 1970, c.N-17), took over powers formerly vested in the Board of Transport Commissioners, the Air Transport Board and the Canadian Maritime Commission, giving it regulatory and judicial functions with respect to almost all aspects of railway, commercial air and merchant marine services. The Act also provides for the regulation of extra-provincial motor vehicle transport and commodity (solids) pipelines but the applicable parts of the Act were not yet in effect as at December 1972. In addition, the Commission is responsible for undertaking studies and research into the economic aspects of all modes of transport within, into or from Canada.

Six committees perform the Commission's regulatory duties under the Act: the Railway Transport Committee; the Air Transport Committee; the Water Transport Committee; the Telecommunication Committee; the Motor Vehicle Transport Committee; and the Commodity Pipeline Transport Committee.

The Commission consists of not more than 17 members, of whom one is president and two are vice-presidents, appointed by the Governor in Council for a maximum of ten years; it reports to Parliament through the Minister of Transport.

Canadian Wheat Board. The Board was incorporated in 1935 under the Canadian Wheat Board Act (RSC 1970, c.C-12) to market, in an orderly manner, in the interprovincial and export trade, grain grown in Canada. Its powers include authority to buy, take delivery of, store, transfer, sell, ship or otherwise dispose of grain. Except as directed by the Governor in Council, the Board was not originally authorized to buy grain other than wheat but, since August 1, 1949, it may also buy oats and barley if authorized to do so by Regulation approved by the Governor in Council. Only grain produced in the designated area, which includes Manitoba, Saskatchewan, Alberta and parts of British Columbia is purchased by the Board, which controls the delivery of grain into elevators and railway cars in that area as well as the interprovincial movement and export of wheat, oats and barley generally. The Board reports to Parliament through a designated Minister, at present the Minister of Justice.

Cape Breton Development Corporation. This Corporation was created by an Act of Parliament, assented to on July 7, 1967 (RSC 1970, c.C-13) and came into existence by proclamation on October 1, 1967, as a proprietary Crown corporation. The Corporation was established to rationalize the coal industry of Cape Breton Island and to broaden the base of the area's economy by assisting the financing and development of industry to provide employment outside the coal mines.

The Cape Breton Development Corporation acquired the former interests of the major coal producer in the Sydney coalfield and is operating three of those mines and developing one new mine. It is actively engaged in development of the tourist industry as well as primary products and various secondary industries.

The Act provides for a board of directors, comprising a chairman, a president and five other directors. Head office is located in Sydney, NS. The Corporation reports to Parliament through the Minister of Regional Economic Expansion. Its operations are financed by the Government of Canada.

Central Mortgage and Housing Corporation. This Corporation was incorporated by Act of Parliament (RSC 1952, c.46) in December 1945 to administer the National Housing Acts. Under the National Housing Act, 1954 (RSC 1970, c.C-16), the Corporation insures mortgage loans made by approved lenders for new and existing housing and makes direct loans in resource communities and rural areas; guarantees home improvement loans made by banks; undertakes subsidized rental housing projects and land assembly developments under federal-provincial arrangements; offers loans and subsidies for public housing projects; makes loans for land assembly projects to be used for general residential development; makes loans to individuals or organizations for low-rental housing projects; makes loans for student housing and to provinces and municipalities with provincial concurrence for sewage treatment projects designed to eliminate water and soil pollution; makes contributions and loans to provinces and municipalities for urban renewal operations; conducts housing research; encourages urban planning; and owns and manages rental housing units including those built for war workers and veterans. The Corporation arranges for and supervises construction of housing projects on behalf of the Department of National Defence and other government departments and agencies. It is responsible to Parliament through the Minister of State for Urban Affairs.

Columbia River Treaty Permanent Engineering Board. The Permanent Engineering Board, consisting of two Canadians and two Americans, was established under Article XV of the 1964 Columbia River Treaty between Canada and the United States. The Board assembles records, inspects and reports at least annually with respect to matters within the scope of the Treaty. It reports to Parliament through the Minister of Energy, Mines and Resources.

Commissioner of Official Languages. Appointed by Parliament pursuant to the Official Languages Act (RSC 1970, c.O-2), the Commissioner holds office for a term of seven years, renewable until age 65. He is responsible to Parliament for ensuring recognition of the equal status of French and English as Canada's official languages and for ensuring compliance with the spirit and intent of the Act in all the institutions of the Parliament and Government of Canada. To this end, the Commissioner is empowered to receive and investigate complaints from the public, and, on his own initiative, to conduct investigations into possible violations of the Act. The results of investigations must be communicated to the complainants and the institutions concerned and may, at the Commissioner's discretion, be the subject of a special report to Parliament. The Commissioner reports annually to Parliament on the conduct of his Office and may make recommendations for changes in the Act as he deems necessary or desirable.

Commonwealth War Graves Commission. The Commission operates under the Original Charter of Incorporation dated May 21, 1917 and the new Supplemental Charter dated June 8, 1964. Under these the Commission is entrusted with the marking and maintaining in perpetuity of the graves of those of the British Empire and Commonwealth Armed Forces who died during World Wars I and II. The Canadian High Commissioner in London, England is the official Commission member for Canada and the Minister of Veterans Affairs is the Agent of the Commission in Canada.

Company of Young Canadians. Established in 1966 as a Crown corporation (RSC 1970, c.C-26), the Company of Young Canadians is a collection of full-time volunteers between the ages of 18 and 28, who work with community groups on projects concerned with legal aid, welfare rights, day care, native rights,

the handicapped and education. The volunteers receive a living allowance from the CYC but are chosen directly by the community group seeking CYC support and are primarily responsible to this reference group. The CYC also employs field staff in the Northwest Territories and in each province, except Prince Edward Island, where they assist community groups in developing projects and placing volunteers.

Both the CYC's administrative nine-member council and executive director who is responsible for supervision and management are appointed by the Governor in Council. The Company reports to Parliament through the Secretary of State.

Copyright Appeal Board. The Board was established to provide an agency to which people using copyrighted music could direct appeals against the fees proposed by Performing Rights Societies for the use of the music. The Copyright Act (RSC 1970, c.C-30) empowers the Board to deal only with the amount of the fees that the Societies propose to collect for an ensuing calendar year. It has no authority to draft the tariffs or terms and conditions of the tariffs. Hearings before the Board are conducted in a quasi-judicial manner. After considering an appeal the Board makes such alterations to the proposed statements of fees as it thinks appropriate and transmits the statements thus altered or revised or unchanged to the Minister of Consumer and Corporate Affairs. The decision of the Board is final and binding.

The Copyright Appeal Board consists of three members appointed by the Governor in Council, one of whom, as chairman, must hold or have held high judicial office.

Court Martial Appeal Court. This Court was established as a superior court of record pursuant to s.201 of the National Defence Act (RSC 1970, c.N-4). Accused persons found guilty by a court martial have the right to direct an appeal to the Court Martial Appeal Court in respect of the legality of any or all of the findings, or the legality of the whole or any part of the sentence. The Appeal Court is composed of not fewer than four judges of the Federal Court of Canada, designated by the Governor in Council and such additional judges of a superior court of criminal jurisdiction as are appointed by the Governor in Council. One judge has been designated by the Governor in Council as the President. Appeals are heard by a minimum of three judges. The Court Martial Appeal Court may sit and hear appeals at any place under direction of the President. An appellant whose appeal has been wholly or partially dismissed by the Court Martial Appeal Court may, under certain circumstances, appeal to the Supreme Court of Canada; where the Court Martial Appeal Court has wholly or partially allowed an appeal, the Minister of National Defence may similarly enter an appeal to the Supreme Court of Canada.

Crown Assets Disposal Corporation. This Corporation was established in 1944 as the War Assets Corporation under the Surplus Crown Assets Act (RSC 1970, c.S-20) and is subject to the Financial Administration Act (RSC 1970, c.F-10). Its name was changed to Crown Assets Disposal Corporation in 1949. The Corporation is responsible for the sale of federal government surplus real estate and commodities located in Canada and at Canadian government establishments throughout the world. It also acts as agent on behalf of foreign governments in selling their surplus assets located in Canada and has reciprocal agreements with a number of European countries for marketing Canadian surplus assets located in their respective countries. Regional offices are maintained in Halifax, Montreal, Toronto, Edmonton and Vancouver. The Corporation is responsible to Parliament through the Minister of Supply and Services.

Defence Construction (1951) Limited. This is the Crown agency that procures for the Department of National Defence the construction and repair of buildings, structures and engineering works and professional engineering and architectural services. It reports to the Minister of National Defence.

The forerunner of the present company, Defence Construction Limited, began operation in November 1950 as a Crown agency responsible for awarding and supervising defence construction projects. Defence Construction (1951) Limited, incorporated July 12, 1951, under authority of the Defence Production Act, took over the responsibilities of the former agency.

The company's responsibilities in contracting for all new construction and repair and renovation projects (except contracts under \$10,000 which are arranged for the Department of National Defence via the Department of Supply and Services) include: participation in preparation of design; calling and reviewing of tenders; award and administration of contracts; supervision of construction work; and certification of progress claims for work completed. Activities cover four distinct spheres: defence projects in Canada for the Department of National Defence; all defence projects in Europe for the Department of National Defence under the North Atlantic Treaty Organization Agreement; defence construction for the United States government in Canada; and, by arrangement, acting as the contract agents or technical advisers on the rendering of assistance to other federal departments and agencies.

The head office of the agency is located at Ottawa and branch offices are maintained at Halifax, Montreal, Toronto, Winnipeg and Vancouver in Canada and in Lahr, Federal Republic of Germany.

Defence Research Board. The Defence Research Board, established in 1947 by an amendment to the National Defence Act (RSC 1970, c.N-4), is concerned with providing scientific advice to the Minister of National Defence, meeting the research requirements of the Canadian Armed Forces, and supporting research of defence interest in Canadian universities and applied research in those industries that require a defence science and technology input. The Board consists of a full-time chairman, a vice-chairman, and a

varying number of members appointed by the Governor in Council for three-year terms. The Deputy Minister of National Defence, the President of the National Research Council and three senior officers of the Canadian Armed Forces are ex-officio members. The Board has its headquarters in Ottawa, research establishments in Nova Scotia, Quebec, Ontario, Alberta and British Columbia and liaison offices in Washington, London and Paris.

Department of Agriculture. This Department was established in 1867 (SC 1868, c.53) and now operates under authority of RSC 1970, c.A-10. It undertakes work on all phases of agriculture. Research and experimentation are carried out by the Research, Health of Animals and Economics branches, and the Grain Research Laboratory; and the maintenance of standards and protection of products, by the Production and Marketing and Health of Animals branches. A new Food Systems Branch was created in 1972. The Canada Grain Act, as it pertains to the inspection, weighing, storage and transportation of grain, is administered by the Canadian Grain Commission; and programs concerning farm income security and price stability are provided under the Crop Insurance Act, the Prairie Farm Assistance Act, the Canadian Dairy Commission Act, the Agricultural Stabilization Act and the Agricultural Products Board. The Farm Credit Corporation, the Canadian Dairy Commission, the Canadian Livestock Feed Board and the National Farm Products Marketing Council report to Parliament through the Minister of Agriculture.

The Agricultural Stabilization Board, a departmental corporation under the Financial Administration Act, the Agricultural Products Board and the Canadian Grain Commission are parts of the Department.

Department of Communications. The Department was established under Part II of the 1969 Government Organization Act and operates under authority of RSC 1970, c.C-24. The Minister of Communications is responsible for fostering the orderly development and growth of communications for Canada. In the domestic field, this includes the extension of existing telecommunications systems and services to obtain optimum benefits in the short and long terms; the development and introduction of new communications systems, facilities and resources; the management of the radio frequency spectrum to permit the development and growth of radio communications; and the development of telecommunications services for the Government of Canada. In the international field, the Department acts to protect and support Canadian interests in international telecommunications systems, services and undertakings. The Minister of Communications reports to Parliament for the Canadian Overseas Telecommunication Corporation and the Canadian Radio-Television Commission.

Department of Consumer and Corporate Affairs. This Department was established in 1967 (RSC 1970, c.C-27) replacing the Department of the Registrar General of Canada. The duties, powers and functions of the Minister extend to and include all matters over which the Parliament of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada, relating to: consumer affairs; corporations and corporate securities; combines, mergers, monopolies and restraint of trade; bankruptcies and insolvencies; and patents, copyrights and trade marks.

The functions of the Department are divided into five main areas. The Bureau of Consumer Affairs co-ordinates government activities in the field of consumer affairs; the Bureau of Corporate Affairs administers the government's corporate activities; the Bureau of Intellectual Property administers laws and regulations pertaining to patents, trade marks, industrial designs and copyrights; and the Bureau of Field Operations supervises the Department's operations across Canada, staffing regional offices in five Canadian cities from coast to coast and district offices in 22 others. Competition policy is regulated by the Director of Investigation and Research under the Combines Investigation Act.

In addition, as Registrar General of Canada, the Minister of Consumer and Corporate Affairs is the custodian of the Great Seal of Canada, the Privy Seal of the Governor General, the Seal of the Administrator of Canada and the Seal of the Registrar General of Canada.

The Restrictive Trade Practices Commission (Combines Investigation Act) is domiciled in the Department and reports directly to the Minister.

Department of Energy, Mines and Resources. The Department of Energy, Mines and Resources was created in 1966 by the Government Organization Act (RSC 1970, c.E-6). The Department, in addition to its administrative services, is organized into three groups: the Science and Technology Group includes the Geological Survey of Canada, the Mines Branch, the Surveys and Mapping Branch, the Earth Physics Branch, the Canada Centre for Remote Sensing, and the Polar Continental Shelf Project, all of which are engaged in research and the provision of information in their respective fields; the Mineral Development Group includes the Quebec regional office, the Mineral Resources Branch, which gathers economic data on all minerals for use by government, industry and the public and conducts administrative functions of resource management, and the Explosives Division which controls, under the provisions of the Explosives Act, the production and handling of explosives; the Energy Development Group has broad responsibilities relating to the development of plans and policies for all forms of energy, the development of programs, legislation and agreements to implement those policies, the direction of studies relating to energy sources and requirements, and the co-ordination of policy advice. The Assistant Deputy Minister (Energy) serves as adviser on over-all plans and policies relating to energy sources and requirements.

Atomic Energy of Canada Limited, Eldorado Nuclear Limited, Eldorado Aviation Limited, the Atomic Energy Control Board, the National Energy Board, and the Interprovincial Boundary Commissions report to Parliament through the Minister of Energy, Mines and Resources.

Operationally the International Boundary Commission reports through the Minister of Energy, Mines and Resources; in dealing with its counterpart in the United States, it is responsible to the Secretary of State for External Affairs.

Department of the Environment. Established by Act of Parliament in June 1971 (SC 1970-71, c.42), this Department carries the main federal responsibility for leading the attack on all forms of pollution and ensuring the proper management and development of Canada's natural resources.

Elements within the federal government previously involved in work related to the environment and renewable resources have been integrated into the Department which has two principal components: Fisheries and Marine Service, and Environmental Services. Each is headed by a Senior Assistant Deputy Minister. Fisheries and Marine Service is responsible for fisheries research, fisheries development and fishing operations on both coasts and in inland waters, ocean-oriented activities which include oceanography and hydrography, as well as the administration of small craft harbours. Environmental Services comprise: Atmospheric Environment Service; Environmental Management Service (including Canadian Forestry Service, Inland Waters Branch, Canadian Wildlife Service, and Lands Directorate); Environmental Protection Service; and Planning and Finance Service.

An Environmental Advisory Council, made up of representatives from industry, the universities and the scientific community, reviews departmental programs and provides advice to the Minister on matters related to environmental protection and resource development. A Forestry Advisory Council and a Fisheries Advisory Council have been established to cover major renewable resources.

The Minister of the Environment, who also carries the title of Minister of Fisheries, reports to Parliament on behalf of the Fisheries Prices Support Board, the Freshwater Fish Marketing Corporation, the Canadian Saltfish Corporation and the Eastern Rockies Forest Conservation Board.

Department of External Affairs. The main function of the Department of External Affairs, established in 1909 (RSC 1970, c.E-20), is the protection and advancement of Canadian interests abroad. The Minister responsible for the Department is the Secretary of State for External Affairs. The senior permanent officer (Deputy Minister) of the Department, the Under-Secretary of State for External Affairs, is assisted by an Associate Under-Secretary and by five Assistant Under-Secretaries and is advised by officers in charge of bureaus, offices and divisions. The directors-general or directors of these units are each responsible for a part of the Department's work and are assisted by foreign service officers, administrative services officers and specialists in various occupational groups, as well as by an administrative staff. Officers serving abroad are formally designated as High Commissioners, Ambassadors, Ministers, Counsellors, First Secretaries, Second Secretaries, Third Secretaries and Attachés at diplomatic posts and Consuls General, Consuls and Vice-Consuls at consular posts. Canada maintains approximately 171 diplomatic, consular and other missions, 58 of which are non-resident.

In Ottawa the work of the Department is conducted by four regional, seven functional and three administrative bureaus, in addition to a number of operational units performing staff or special functions. The four regional bureaus administer 12 geographical divisions, each of which is responsible for the countries that make up the region administered by the bureau to which it belongs: the European Affairs Bureau includes three divisions — Western Europe, Eastern Europe and Northwestern Europe including Britain; the Bureau of Asian and Pacific Affairs includes the East Asia, Pacific and South Asia divisions; the Bureau of African and Middle Eastern Affairs, the African Affairs I, African Affairs II and Middle Eastern divisions; and the Bureau of Western Hemisphere Affairs, the Caribbean (Commonwealth), Latin American and United States of America divisions. The seven functional bureaus include 20 divisions: the Bureau of Economic and Scientific Affairs comprises the Aid and Development, Commercial Policy, Scientific Relations and Environmental Problems, and Transport, Communications and Energy divisions; the Bureau of Legal Affairs includes the Legal Advisory and Legal Operations divisions; the Bureau of Consular Affairs, the Consular Operations, and Consular Policy and Research divisions; the Bureau of Defence and Arms Control Affairs, the Arms Control and Disarmament, and Defence Relations divisions; the Bureau of Public Affairs, the Academic Relations Service, Cultural Affairs, Historical, Information and World Exhibitions Program divisions; the Bureau of Coordination, the Commonwealth Institutions, Federal-Provincial Coordination and Francophone Institutions divisions; and the Bureau of United Nations Affairs, the United Nations Economic and Social Affairs and United Nations Political and Institutional Affairs divisions. The four administrative bureaus are responsible respectively for Personnel, Finance and Administration, Communications and General Services, and Security and Intelligence Liaison. In addition, there is an Inspection Service, a Policy Analysis Group, an Operations Centre, a Central Staff, an Interdepartmental Committee on External Relations, and a Special Adviser on Foreign Service appointments and related policies.

The International Joint Commission reports to the Secretary of State for External Affairs of Canada as well as to the Secretary of State of the United States. The Secretary of State for External Affairs reports to Parliament for the Canadian International Development Agency.

Department of Finance. Created by Act of Parliament in 1869, this Department now operates under the Financial Administration Act (RSC 1970, c.F-10 as amended by SC 1970-71, cc.42,55). It is primarily responsible for advice to the government on the economic and financial affairs of Canada. The work of the Department is carried out in six branches. The Tax Policy Branch helps form tax policy and maintain the tax structure in good order so that revenues required by the government will be raised in the best possible way. Its work is carried out in the Personal, Commodity and Estates Tax Division, the Corporation and Business Income Division and the International Tax Section. The Federal-Provincial Relations and Economic Programs Branch comprises the Economic Development, Resource Program, Federal-Provincial Relations, and Social Development and Manpower Policy divisions and the Municipal Grants section. The Tariff, Trade and Aid Branch has the following divisions: Tariffs, International Economic Relations and International Programs. The Economic Analysis, Fiscal Policy and International Finance Branch includes the Economic Analysis Division, Fiscal Policy Division, Fiscal Analysis and Forecasting Division and the International Finance Division. The Financial Operations Branch has the Capital Markets Division and Government Finance, Loans, Investments and Guarantees Division. The Long-Range Economic Planning Branch is responsible for co-ordinating, planning and developing medium- and long- term economic measures and policies. The Inspector General of Banks is an office of the Department. In addition, the following agencies report to Parliament through the Minister of Finance: the Anti-dumping Tribunal, the Bank of Canada, the Canada Deposit Insurance Corporation, the Industrial Development Bank, the Department of Insurance and the Tariff Board. The Minister of Finance acts as spokesman in Parliament for the Auditor General.

Department of Indian Affairs and Northern Development. The Department of Indian Affairs and Northern Development was established in June 1966, superseding the Department of Northern Affairs and National Resources; it now operates under authority of RSC 1970, c.I-7. In 1968, the Department was reorganized, creating, in addition to departmental support services and a Technical Services Branch, three distinct program areas: the Indian and Eskimo Affairs Program includes education, community affairs, economic development for Indians and Eskimos and Indian trust administration; the Northern Development Program covers major resource development in the Canadian North, management of territorial resources along with economic research and advice; and the Conservation Program, including National Parks and Historic Sites and Parks.

The Commissioner of the Northwest Territories and the Commissioner of the Yukon Territory report to Parliament through the Minister of Indian Affairs and Northern Development. The Minister is also responsible to Parliament for the Northern Canada Power Commission, the National Battlefields Commission and the Historic Sites and Monuments Board of Canada. The Northern Scientific Adviser's Office acts in an advisory capacity to the Minister.

Department of Industry, Trade and Commerce. In 1969, the Departments of Industry and of Trade and Commerce were merged to form the Department of Industry, Trade and Commerce (ITC), which operates under authority of RSC 1970, c.I-11. ITC promotes the establishment, growth and efficiency of manufacturing, processing and tourist industries in Canada and fosters the development of Canadian trade. The Department plans and carries out programs to assist manufacturing and processing industries in adapting to new technology and changing market conditions, in developing unrealized potential and in rationalizing productive facilities and corporate structures. It promotes product and process development, increased productivity, greater use of research, modern equipment, improved industrial design, the application of advanced technology and modern management techniques, and the development and application of sound industrial standards in Canada and in world trade.

In addition, the Department's functions include: improving access of Canadian goods and services into external markets through trade negotiations; contributing to the improvement of world trading conditions; providing support services for industrial and trade development, including information, import analysis and traffic services; analyzing the implications for Canadian industry, trade and commerce and for tourism of government policies related thereto in order to contribute to the formulation and review of those policies; and compiling and updating detailed information on trends and developments in Canada and abroad related to the manufacturing and processing and tourist industries.

The Department is organized into six major functional groups: Office of Tourism, Industry Development, Industrial Policies, Export Development, International Trade Relations and Administration. The Office of Tourism includes the Travel Industry Branch and the Canadian Government Travel Bureau. The Industry Development component is made up of nine Industry Development Branches which cover the major industry groupings in Canada: Aerospace, Marine and Rail; Agriculture, Fisheries and Food Products; Apparel and Textiles; Chemicals; Electrical and Electronics; Machinery; Materials; Mechanical Transport and Wood Products. The Industrial Policies segment includes the Office of Science and Technology, the Office of the Industrial Policy Adviser and the Office of Design. The Export Development section comprises Export Projects, Financing and Aid, Grains, Transportation and Trade Services, and Fairs and Missions. Reporting to the International Trade Relations sector is the Office of General Relations, the Office of Special Import Policy and the Office of Export/Import Permits. Administration is responsible for the areas of Finance, Personnel, Information Services and Program

Analysis. In addition, the Department operates eight regional offices located across Canada and the Trade Commissioner Service which has 82 trade offices in 57 countries.

The Minister also reports to Parliament on behalf of Statistics Canada and the Export Development Corporation. Boards and other organizations reporting to the Minister are the General Adjustment Assistance Board, the Machinery and Equipment Advisory Board, the Pharmaceutical Industry Development Advisory Committee, the National Design Council, the Standards Council of Canada, the Textile and Clothing Board, the Preparatory Commission for Metric Conversion and the Minister's Advisory Council.

Department of Insurance. The Minister of Finance is responsible for the Department of Insurance which originated in 1875 as a branch of the Department of Finance but was constituted a separate Department in 1910. It is authorized and governed by the Department of Insurance Act (RSC 1970, c.I-17). Under the Superintendent of Insurance, who is the Deputy Head, the Department administers the statutes of Canada applicable to federally incorporated insurance, trust, loan and investment companies; provincially incorporated insurance companies registered with the Department; British and foreign insurance companies operating in Canada; small loans companies and money-lenders; co-operative credit societies registered under the Co-operative Credit Associations Act; pension plans organized and administered for the benefit of persons employed in connection with certain federal works, undertakings and businesses; and life insurance issued to certain members of the Public Service prior to May 1954.

Under the relevant provincial statutes, the Department examines trust and loan companies incorporated in Nova Scotia, trust companies incorporated in New Brunswick and insurance and trust companies incorporated in Manitoba. It reports to Parliament through the Minister of Finance.

Department of Justice. This Department, established by SC 1868, c.39, now operates under authority of the Department of Justice Act (RSC 1970, c.J-2). The Minister of Justice is the official legal adviser of the Governor General and the legal member of the Queen's Privy Council for Canada. It is his duty to see that the administration of public affairs is in accordance with law, to superintend all matters connected with the administration of justice in Canada that are not within the jurisdiction of the provincial governments, to advise upon the legislation and proceedings of the provincial legislatures, and generally to advise the Crown on all matters of law referred to him by the Crown. The Minister of Justice is, ex officio, Her Majesty's Attorney General of Canada. In this capacity it is his duty to advise the heads of the departments of the Government of Canada on all matters of law connected with such departments, to settle and approve all instruments issued under the Great Seal of Canada, and to regulate and conduct all litigation for or against the Crown in the right of Canada.

The Minister of Justice reports to Parliament for the Tax Review Board, the Law Reform Commission of Canada, and at present, is the designated Minister responsible for the Canadian Wheat Board.

Department of Labour. The Department of Labour was established in 1900 by Act of Parliament (SC 1900, c.24) and now operates under the authority of the Department of Labour Act (RSC 1970, c.L-2). The Department administers, under the Minister of Labour, legislation dealing with: fair employment practices; hours of work, minimum wages, annual vacations, holidays with pay, equal wages, group and individual terminations of employment, severance pay and the regulation of fair wages and hours of labour in contracts made with the Government of Canada for construction, remodelling, repair or demolition of any work; government employee compensation, merchant seamen compensation, and employment safety; and transitional assistance benefits for auto workers and adjustment assistance benefits for textile workers. It promotes joint consultation with industries through labour management committees and operates a women's bureau. The Department publishes the *Labour Gazette* and other publications as well as general information on labour management, employment, manpower and related subjects.

The Merchant Seamen Compensation Board reports to the Minister of Labour. The Department is the official liaison agency between the Canadian government and the International Labour Organization. The Canada Labour Relations Board and Information Canada report to Parliament through the Minister of Labour.

Department of Manpower and Immigration. The Department of Manpower and Immigration, created under the provisions of the Government Organization Act 1966 and operating now under RSC 1970, c.M-1, has responsibility for the development and utilization of manpower resources in Canada, employment services and immigration. The Department is composed of three operational arms: Operations Canada; the Manpower and Immigration Divisions; and two support service divisions – Program Development and Administration. Operations Canada directs the activities of some 390 Canada Manpower Centres and 95 Immigration Centres in Canada assisted and co-ordinated by five regional offices located in Halifax, Montreal, Toronto, Winnipeg and Vancouver. The Canada Manpower Division is responsible for counselling programs, manpower training and mobility programs, employer services and services for disadvantaged workers and students. The Canada Immigration Division administers the Immigration Act and Regulations and is responsible for the selection, examination, movement and admission of immigrants to Canada, and for the exclusion or deportation of undesirable persons. The Department maintains some 50 immigration offices abroad. The Department's support branches include the Program Development

Service, which supplies development and evaluation research and the Administration Division which provides financial and management services, and personnel and information services.

The Canada Manpower and Immigration Council, the Immigration Appeal Board and the Unemployment Insurance Commission report to Parliament through the Minister of Manpower and Immigration.

Department of National Defence. The Department of National Defence and the Canadian Forces operate under the National Defence Act (RSC 1970, c.N-4). The control and management of all matters relating to national defence, the Canadian Armed Forces and the Defence Research Board are the responsibility of the Minister of National Defence; duties and functions relating to civil emergency operations in peace and war are also assigned to the Department, with the Canadian Forces undertaking the role.

The Canadian Forces Reorganization Act of 1968 unified the Royal Canadian Navy, the Canadian Army and the Royal Canadian Air Force into a single service called the Canadian Armed Forces. The civilian administration of the Department is organized under the Deputy Minister, who maintains control over the financial aspects of operational policy, logistics, and personnel and administration. The Defence Research Board, created in 1947, conducts research relating to the defence of Canada and also undertakes the development of or improvements in materiel.

A Defence Council, consisting of the Minister of National Defence as Chairman, the Deputy Minister of National Defence, the Chief of the Defence Staff, the Chairman of the Defence Research Board and the Vice Chief of the Defence Staff, meets at regular intervals to consider and advise on major policy matters.

The Crown corporation, Defence Construction (1951) Limited, reports to Parliament through the Minister of National Defence. The Emergency Measures Organization (EMO) reports to the Minister of National Defence through the Deputy Minister.

Department of National Health and Welfare. This Department was established in October 1944 under the Department of National Health and Welfare Act (RSC 1970, c.N-9). An Administration Branch serves both the health and the welfare branches. At present the Deputy Minister of Health administers four branches: Health Programs, Health Protection, Medical Services and Long Range Health Planning; the Deputy Minister of Welfare administers six branches: Income Security, International and Emergency Welfare, Social Allowances and Services, Canada Pension Plan, Policy Research Planning and Evaluation, and Developmental Programs. The two Deputy Ministers are also involved in Canada's role in international health and welfare programs.

Departmental programs on health include hospital insurance and diagnostic services, medical care insurance, health resources, food and drug supervision, narcotics control, national health grants, federal emergency health services, environmental health, adverse drug reaction reporting, operation of a central clearing house for poison control centres, health, medical and hospital services to Indians and Eskimos across Canada and all residents of the Yukon Territory and Northwest Territories, government employee health services and leprosy control as well as assistance and consultation services to the provinces on request.

Welfare programs including the Canada Pension Plan, old age security and guaranteed income supplements, family and youth allowances, the Canada Assistance Plan and emergency welfare are largely of an income-support nature. In addition, the Department administers a fitness and amateur sport program, and a system of grants for professional training and research.

The National Council of Welfare reports directly to the Minister who also reports to Parliament for the Medical Research Council.

Department of National Revenue. From Confederation until May 1918, customs and inland revenue Acts were administered by separate departments; after that date they were amalgamated under one Minister as the Department of Customs and Inland Revenue. In 1921 the name was changed to the Department of Customs and Excise. In April 1924 collection of income taxes was placed under the Minister of Customs and Excise and, under the Department of National Revenue Act, 1927, the Department became known as the Department of National Revenue. It operates now under RSC 1970, c.N-15.

The Customs and Excise Division of the Department is responsible for the assessment and collection of customs and excise duties as well as of sales and excise taxes. The Taxation Division is responsible for the assessment and collection of income taxes, old age security tax, Part I of the Canada Pension Plan, and collection of premiums and administration of the coverage provisions of the Unemployment Insurance Act through its 28 district taxation offices and its Taxation Data Centre.

Department of Public Works. The Department was constituted in 1867 and operates under the legislative authority of the Public Works Act (RSC 1970, c.P-38). It is responsible for the management and direction of the public works of Canada and, except as specifically provided in other Acts, attends to the construction and maintenance of public buildings, wharves, piers, roads and bridges and the undertaking of dredging and protection work. Federal government interest in the Trans-Canada Highway and the Northwest Highway System is also handled by the Department. The Department has regional offices at Halifax, Montreal, Ottawa, Toronto, Edmonton and Vancouver; subsidiary offices at other key points across the country are also maintained. Departmental organization includes four major areas of operation: Design

and Construction; Realty; Planning and Systems; and Technological Research and Development, together with the Directorate of Customer and Public Relations, the Financial Adviser, the Personnel Adviser and the Dominion Fire Commissioner — all reporting to the Deputy Minister.

Department of Regional Economic Expansion. This Department was established in 1969 (RSC 1970, c.R-4). Its function is to ensure that economic growth is dispersed widely enough across Canada to bring employment and earning opportunities in the slow-growth regions as close as possible to those in the other parts of the country, without interfering with a high over-all rate of national growth. The legislation authorizes the Department, in co-operation with provincial governments and other federal agencies, to prepare development plans and programs designed to meet the special needs of particular areas.

The Department has six major divisions, each under the control of an Assistant Deputy Minister: Planning, Incentives, Co-ordination and Liaison, and the Eastern, Central and Western Regions. A major program provides development incentives to industry, in the form of cash grants, to encourage new productive employment in designated regions where such employment has been scarce. In 23 special areas, the Department is taking special action to encourage economic development and social adjustment. The Department is also responsible for programs under the Agricultural and Rural Development Act (ARDA); the Fund for Rural Economic Development (FRED); and the Prairie Farm Rehabilitation Act (PFRA) which is concerned with land-use adjustment, water development projects and the establishment of tree shelterbelts. An Atlantic Development Council advises the Minister on programs and policies for fostering economic development and social adjustment in the Atlantic region.

The Minister of Regional Economic Expansion reports to Parliament for the Cape Breton Development Corporation, the New Brunswick Multiplex Corporation and the Canadian Council on Rural Development.

Department of the Secretary of State. The duties, powers and functions of the Secretary of State of Canada (SC 1966-67, c.25) extend to and include all matters over which the Parliament of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada, relating to: citizenship; elections; State ceremonial, the conduct of State correspondence and the custody of State records and documents; the encouragement of the literary, visual and performing arts, learning and cultural activities; and libraries, archives, historical resources, museums, galleries, theatres, films and broadcasting.

The responsibilities of the Department of the Secretary of State include those pertaining to the administration of the following branches: Citizenship; Citizenship Registration; Education Support; Bilingualism Development Programmes; Arts and Culture; State Protocol and Special Events; and Translation Bureau. A Minister of State is responsible for matters pertaining to multiculturalism.

The Secretary of State reports to Parliament for the Canadian Film Development Corporation, the National Arts Centre Corporation, the National Film Board, the National Library, the Public Archives, the National Museums of Canada, the Canada Council, the Canadian Broadcasting Corporation, the Company of Young Canadians and the Public Service Commission and acts as spokesman for the Office of the Representation Commissioner. In addition, the Secretary of State is responsible for the financial and administrative affairs of the Bilingual Districts Advisory Board.

Department of the Solicitor General. Before 1936, the Office of the Solicitor General was either a Cabinet post or a Ministerial post outside the Cabinet. From 1936 to 1945 the position did not exist, the duties of the Office being wholly absorbed by the Attorney General of Canada. The Solicitor General Act, 1945 re-established the Solicitor General as a Cabinet officer and provided that "the Solicitor General shall assist the Minister of Justice in the Counsel work of the Department of Justice, and shall be charged with such other duties as are at any time assigned to him by the Governor-in-Council". This legislation was repealed in 1966 when a new Department of the Solicitor General was created (RSC 1970, c.S-12); the Solicitor General of Canada became the Cabinet Minister with primary responsibility in the fields of correction and law enforcement. He is responsible for the Royal Canadian Mounted Police, the Canadian Penitentiary Service and also reports to Parliament for the National Parole Board, which is an independent agency.

Department of Supply and Services. The Department of Supply and Services was established on April 1, 1969 (RSC 1970, c.S-18) and incorporates certain services previously provided by other departments, in line with the recommendations of the Royal Commission on Government Organization (Glassco Commission) which had stressed the need for the federal government to foster efficiency and effect economies wherever possible. The Minister of Supply and Services is also the Receiver General for Canada and exercises all the duties, powers and functions assigned to that office by law.

The Department is organized into two major administrations, each headed by a Deputy Minister directly responsible to the Minister. The Supply Administration administers the Supply Programme, the objective of which is to acquire and provide, at minimum cost, goods and services required by federal government departments and agencies. It also maintains federal government equipment and provides printing facilities. The Supply Administration has 13 regional or district supply offices across Canada; at various locations within these areas it provides purchasing and warehousing services and other services

such as field contract administration, equipment maintenance, security, emergency supply planning, assets management and printing. The Overseas Region consists of two supply offices, one in London, England and the other in Koblenz, Federal Republic of Germany and one contract administration office in Washington, DC. The Supply Administration is organized into Commercial Supply Service, Science and Engineering Procurement Service and Corporate Management Service.

The Services Administration, acting for the Receiver General, provides payment or cheque-issuing services on behalf of all federal departments, maintains the fiscal accounts of Canada and prepares the public accounts. It offers departments and agencies a broad range of management and advisory services in management consulting, auditing and computer services fields. It also provides administrative services for all departments in connection with pay, pensions and other employee benefit plans, together with financial management reports and statistical information related to its cheque-issuing function. Service functions are carried out through approximately 40 regional and district offices throughout Canada and abroad.

The Minister of Supply and Services reports to Parliament for the Canadian Commercial Corporation, Canadian Arsenals Limited, Crown Assets Disposal Corporation and the Royal Canadian Mint.

Department of Veterans Affairs. This Department, established in 1944 (RSC 1970, c.V-1), is concerned exclusively with the welfare of veterans and with the dependants of veterans and of those who died during active service. The Department is empowered to provide treatment services (hospital, medical, dental and prosthetic), welfare services, education assistance, life insurance, and land settlement and home construction assistance. The Veterans' Bureau, which on March 31, 1971 (SC 1970-71, c.31) became the Bureau of Pensions Advocates, assists veterans in the preparation and presentation of pension claims. The same statute authorized the establishment of the Pension Review Board, an independent body that provides a new and improved adjudicating process of appeal for the veteran who is dissatisfied with a previous ruling of the Entitlement Board of the Canadian Pension Commission or a decision of two members of the Commission.

The Department has treatment institutions and facilities in eight major urban centres and three veterans homes across Canada and it maintains administrative offices in the large cities and in London, England. The offices in Canada are shared with the Canadian Pension Commission, the War Veterans Allowance Board and the Bureau of Pensions Advocates.

The Canadian Pension Commission, the War Veterans Allowance Board, the Bureau of Pensions Advocates, the Pension Review Board and the Army Benevolent Fund Board report to Parliament through the Minister of Veterans Affairs.

Director of Soldier Settlement and Director of the Veterans' Land Act. The Director of Soldier Settlement (SC 1919, c.71) is also the Director of the Veterans' Land Act (RSC 1970, c.V-4), and in each capacity is legally a corporation sole. For administrative purposes, however, the programs carried on under both Acts constitute integral parts of the services provided by the Department of Veterans Affairs.

Dominion Council of Health. Established under the Department of National Health and Welfare Act (RSC 1970, c.N-9), the Dominion Council of Health is an advisory body to the Minister of National Health and Welfare on matters relating to the health of Canadians. It assists in the co-ordination of federal-provincial health programs and in liaison with federal and provincial health authorities. The Council meets twice a year and consists of the Deputy Minister of National Health, who acts as chairman, the Deputy Minister of Health for each province and five members, appointed by Order in Council for three-year periods, who represent various segments of the Canadian population.

Dominion Fire Commissioner. The Commissioner is responsible for directing fire protection and fire prevention programs throughout all the civil departments of the federal government. His Office compiles civilian fire cause and loss statistics on a national basis; he presents the data in his annual report to the Minister of Public Works. The Office of the Dominion Fire Commissioner is part of the Department of Public Works.

Eastern Rockies Forest Conservation Board. The Board was appointed in 1947 under the Eastern Rocky Mountain Forest Conservation Act (SC 1947, c.59) which authorized an agreement between the federal government and Alberta relating to the protection and conservation of the forests on that portion of the eastern slope of the Rocky Mountains which gives rise to the major tributaries of the Saskatchewan River. Its function is to determine the policy necessary to obtain the greatest possible flow of water in the Saskatchewan River system. The planning of programs of forest use and conservation is a joint duty of the Board and the provincial Forest Service; the administration of the conservation area is a function of the province. In April 1962, a Technical Co-ordinating Committee for Watershed Research was established to undertake study of the related needs defined by the Board. The Committee's programs, undertaken by seven co-operating agencies of the federal and Alberta governments, are co-ordinated by an officer of the federal Department of the Environment.

Funds for capital expenditures during the first seven years of the agreement were provided by the federal government with maintenance expenditures being paid by Alberta. In 1955 the province undertook the responsibility of financing both capital improvements and maintenance work. Currently, one member of the three-man Board is appointed by the federal government and the province has the right to appoint

two members. The choice of one of the three members as Board chairman is vested in the province. The Board reports to Parliament through the Minister of the Environment.

This Board will complete its planned 25-year program and go out of existence March 31, 1973.

Economic Council of Canada. This corporation, established under legislation passed on August 2, 1963 (RSC 1970, c. E-1), consists of a full-time chairman, two full-time directors appointed for a term not to exceed seven years, and not more than 25 additional members to serve part-time and without remuneration. The Council is to be as representative as possible of labour, agriculture and primary industries, secondary industry and commerce, and the general public. Its functions are to advise and recommend measures that will achieve in Canada the highest possible levels of employment and efficient production so that the country may enjoy a high and consistent rate of economic growth and that all Canadians may share in rising living standards; to promote and expedite continuing improvement in productive efficiency in the various aspects of Canadian economic activity; and to publish an annual review of medium- and long-term economic prospects and problems. The Council reports to Parliament through the Prime Minister.

Eldorado Aviation Limited. This company was incorporated April 23, 1953 to carry air traffic, both passenger and freight, for Eldorado Nuclear Limited and its wholly owned subsidiary, Northern Transportation Company Limited. It reports to Parliament through the Minister of Energy, Mines and Resources.

Eldorado Nuclear Limited. Set up in 1944 (RSC 1952, c.53) under the name of Eldorado Mining and Refining (1944) Limited (the date was omitted in June 1952 and the name changed in 1968), the Crown company's business is the mining and refining of uranium and the production of nuclear fuels in Canada. The company also acts as a custodian for Her Majesty of concentrates purchased under stockpiling contracts. It reports to Parliament through the Minister of Energy, Mines and Resources.

Export Development Corporation. This Corporation operates under authority of the Export Development Act (RSC 1970, c.E-18 as amended by SC 1970-71, c.23). Its purpose is to facilitate the development of Canada's export trade by the provision of expanded insurance, guarantee, loan and other financial facilities which enable Canadian firms to meet international credit competition. It reports to Parliament through the Minister of Industry, Trade and Commerce. Its affairs are administered by a 12-man board of directors. The chairman and six other directors are appointed from among persons employed in the Public Service of Canada, the remaining five from private business. The Corporation's functions are: to insure Canadian exporters against non-payment by foreign buyers due to credit or political risks over which neither buyer nor seller has any control; to issue guarantees to persons in respect of the financing of exports; to make loans to foreign buyers or to issue guarantees in respect of the purchase of capital goods or major services from Canada involving extended credit terms; and to insure Canadian investments abroad against non-commercial risks such as war or revolution, expropriation or confiscation, or the inability to repatriate capital or earnings.

Farm Credit Corporation. This Corporation which was established on October 5, 1959 (RSC 1970, c.F-2) is a Crown corporation responsible to Parliament through the Minister of Agriculture. Under the Farm Credit Act it makes long-term mortgage loans to assist farmers in developing viable farm businesses. It also administers the Farm Syndicates Credit Act and acts as an agent of the Canada Department of Agriculture in administering the Land Transfer Plan of the Small Farm Development Program.

Fisheries Prices Support Board. The Board was set up under the Fisheries Prices Support Act of 1944 (RSC 1970, c.F-23) to recommend to the government price support measures when severe price declines occur. The Board functions under the direction of the Minister of Fisheries and consists of a chairman, who is a senior officer of the Department and five members chosen from private and co-operative firms in the industry. The Board has authority to buy fish products and to sell or otherwise dispose of them or to pay producers the difference between a price prescribed by the Board and the average price the product actually commands.

Fisheries Research Board of Canada. The Board is a research body operating under an Act of Parliament (RSC 1970, c.F-24) to advise the Minister of Fisheries on research and development programs within the Fisheries and Marine Service, Department of the Environment. The Board's 18 members are scientists from universities and provincial research councils and senior executives from Canada's fishing industry.

Foreign Claims Commission. By Order in Council PC 1970-2077 of December 8, 1970 the Canadian government established the Foreign Claims Commission to inquire into property claims made by Canadian citizens and the Government of Canada against foreign countries which may, from time to time, be referred to the Commission by the government. The reference is made after the government has negotiated a lump sum agreement with the foreign country. The Commissioners submit reports and recommendations regarding each claim to the Secretary of State for External Affairs and the Minister of Finance, stating whether, in the opinion of the Commissioners, each claimant is eligible to receive a payment under regulations promulgated from time to time by Order in Council. Up to March 31, 1973 claims against Hungary, Romania and Poland had been referred to the Commission.

Freshwater Fish Marketing Corporation. This Corporation was established under the Freshwater Fish Marketing Act (RSC 1970, c.F-13) which received Royal Assent on February 27, 1969, and was given the function of marketing and trading in fish, fish products and fish by-products in and out of Canada with the objectives of ensuring more orderly marketing for the benefit of the whole fishery and achieving higher and more stable prices for the catch. The Corporation received a grant for initial operating and establishment expenses but conducts its operations on a self-sustaining basis without parliamentary appropriations; it is financed by bank loans with government guarantee of repayment or by direct loans. The Corporation consists of a board of directors composed of a chairman, a president, one director for each participating province and four other directors appointed by the Governor in Council for a term not exceeding five years. The Corporation reports to Parliament through the Minister of the Environment.

General Adjustment Assistance Board. This Board administers the General Adjustment Assistance Program, established in 1968 (SC 1967-68, c.34) and revised in 1971. The Program helps manufacturers take advantage of export opportunities arising from the Kennedy Round; assists manufacturers of textiles, clothing goods or footwear to improve their competitive position in domestic or export markets; and aids those who have been injured, or threatened with injury, as a result of Kennedy Round reductions of Canadian tariffs. Financial assistance is also made available in the form of government insurance on loans, direct loans and grants to manufacturers for restructuring projects necessitated by tariff changes. The Board has members representing both private industry and government and reports to the Minister of Industry, Trade and Commerce.

Grains Group. In 1970, the Minister responsible for the Canadian Wheat Board (at present, the Minister of Justice) organized the Special Group on Grains, known as the Grains Group. The Group consists of representatives from the railways and the Canadian Transport Commission and components of the Canada Department of Agriculture and of the Department of Industry, Trade and Commerce. Its role is to co-ordinate, to review and to recommend federal policies for grains, grain production and handling.

Halifax Relief Commission. The Halifax Relief Commission was established (SC 1918, c.24) to carry on the work of the Halifax Relief Committee, formed by citizens following the explosion in Halifax on December 6, 1917. The Commission, in addition to conducting inquiries into the losses and damage which resulted from the explosion, is charged with the administration of relief funds. The Prime Minister is responsible for the Commission, but its financial arrangements are made through the Minister of Finance.

Heritage Canada. Established under Part II of the Canada Corporations Act (RSC 1970, c.C-32), Heritage Canada is a national trust. It will be concerned with the conservation of buildings, sites, natural and scenic areas of importance to the country's heritage. The interest from an initial federal capital endowment of \$12 million will be used to further its objectives. Heritage Canada will seek to enlist the support of the general public, foundations and corporations; membership will be open to anyone. It is responsible to Parliament through the Minister of Indian Affairs and Northern Development.

Historic Sites and Monuments Board of Canada. This Board was established in 1919 and now operates under authority of RSC 1970, c.H-6. It is an appointed body of 12 provincial and two federal officials which advises the Minister of Indian Affairs and Northern Development on matters of national historic importance with particular reference to commemoration or preservation.

Immigration Appeal Board. The Immigration Appeal Board was established in 1967 by the Immigration Appeal Board Act (RSC 1970, c.I-3). The Board is a court of record, with broad discretionary powers to permit the temporary or permanent admission of individuals, notwithstanding contrary provisions of the Immigration Act. The establishing Act provides for the operation of the Board and in particular for the legal and administrative processes involved in appeals by individuals against deportation, detention and the refusal of admission of sponsored relatives ordered under the provisions of the Immigration Act or Regulations. An appeal lies to the Federal Court of Canada and to the Supreme Court of Canada on leave.

The Board consists of nine members and sits at Ottawa, Montreal and Toronto. It reports to Parliament through the Minister of Manpower and Immigration.

Indian Claims Commission. This Commission, established by Order in Council PC 1969-2405, is responsible for studying Indian grievances and claims in consultation with Indian representatives and reporting on means for settlement. The one Commissioner reports to the Governor in Council through the Prime Minister.

Industrial Development Bank. The Bank, a subsidiary of the Bank of Canada, was incorporated in 1944 (RSC 1970, c.I-9) to supplement the activities of other lenders with particular consideration to the financing problems of small enterprises.

Information Canada. This organization, established April 1, 1970, was created to explain to Canadians the many aspects of the federal government, its programs and services. Such information is produced and disseminated by conventional means and also through regional inquiry centres set up across the country. Equally important is its responsibility to provide the federal government departments and agencies with

information on the attitudes and opinions of the Canadian people, as expressed individually or through the media. On request, the organization will co-ordinate federal information programs and assist departments and agencies to improve the quality and efficiency of their information services.

On the date of its establishment, Information Canada assumed responsibility for the publishing functions of the Queen's Printer and for the Canadian Government Exhibition Commission (now Information Canada - Expositions Division); it also assumed responsibility for the Still Photo Library of the National Film Board (now Information Canada - Photothèque). Information Canada reports to Parliament through the Minister of Labour.

Inspector General of Banks. The Inspector General of Banks is required by Parliament to conduct examinations and inquiries into the affairs and business of chartered banks and the bank incorporated under the Quebec Savings Bank Act to satisfy himself that the provisions of the respective acts are being observed and that the banks are in a sound financial position. The Department of Finance includes the Office of the Inspector General of Banks.

Inter-American Development Bank (Canadian Section). Canada became a full member of the Inter-American Development Bank in May 1972. The Secretary of State for External Affairs reports to Parliament for the Canadian Section of the Bank.

International Boundary Commission. The Commission functions by virtue of the treaty of 1925 (RSC 1970, c.1-19) between Canada and the United States. The International Boundary Commissioners, one for Canada and one for the United States, are empowered to inspect the boundary, to repair, relocate and rebuild monuments, to keep the boundary vistas open, to maintain at all times an effective boundary line, and to determine the location of any point on the boundary which may become necessary in the settlement of any question that may arise between the two governments. The staff of the Canadian section of the Commission is provided by the Department of Energy, Mines and Resources, but the Canadian Commissioner reports to the Secretary of State for External Affairs. The Commissioners meet at least once annually, alternately in Ottawa and Washington.

International Development Research Centre. Established as a public corporation by Act of Parliament (RSC 1970, c.21, 1st Supp.), the International Development Research Centre is an international organization supported financially by Canada. Its objectives are to initiate, encourage, support and conduct research into the problems of developing countries and into methods of applying and adapting scientific and technical knowledge to their socio-economic advancement. One of the Centre's chief purposes is to assist these countries to develop their own research skills and facilities.

The International Development Research Centre's board of governors consists of a chairman, a president and not more than 19 other members, nine of whom must be Canadian citizens. The Centre reports to Parliament through the Secretary of State for External Affairs.

International Fisheries Commissions. The Minister of Fisheries reports to Parliament for the Canadian sections of the several international fisheries commissions of which Canada is a member.

International Joint Commission. This Commission was established under a Britain - United States treaty signed January 11, 1909 and ratified by Canada in 1911 (SC 1911, c.28, as amended). The Commission, composed of six members (three appointed by the President of the United States and three by the Government of Canada), is governed by five specific Articles of the Boundary Waters Treaty of 1909. The Commission's approval is required for any use, obstruction or diversion of boundary waters affecting the natural level or flow of boundary waters in the other country; and for any works in waters flowing from boundary waters or below the boundary in rivers flowing across the boundary which raise the natural level of waters on the other side of the boundary.

Problems arising along the common frontier are also referred to the Commission by either country for examination and report, such report to contain appropriate conclusions and recommendations. In addition, questions or matters of difference between the two countries may be referred to the Commission for decision, provided both countries consent.

The Commission has been given responsibilities under the Canada - United States Great Lakes Water Quality Agreement of April 15, 1972 to assist in the implementation of the Agreement by co-ordinating the various programs referred to therein and monitoring their effectiveness.

The Commission reports to the Secretary of State for External Affairs of Canada and to the Secretary of State of the United States.

Interprovincial Boundary Commission. The Manitoba-Saskatchewan Interprovincial Boundary Commission, consisting of a commissioner from each province and the Surveyor General of Canada, is the only commission concerned with boundaries between provinces. However, there are also boundary commissions responsible for the borders between the following provinces and territories: Manitoba and the Northwest Territories; Saskatchewan and the Northwest Territories; Alberta and the Northwest Territories; and British Columbia, the Yukon Territory and the Northwest Territories. All these commissions report to Parliament through the Minister of Energy, Mines and Resources.

Law Reform Commission of Canada. The Law Reform Commission of Canada was established (RSC 1970, c.23, 1st Supp.) as a permanent body to study and keep the statutes and other laws of Canada under continuing and systematic review and in this way to complement the legislative and judicial processes. The work of the Commission is carried out with a view to making recommendations for their improvement, modernization and reform, including, without limiting the generality of the foregoing: the removal of anachronisms and anomalies in the law; the reflection in and by the law of the distinctive concepts and institutions of the common law and civil law legal systems in Canada, and the reconciliation of differences and discrepancies in the expression and application of the law arising out of differences in those concepts and institutions; the elimination of obsolete laws; and the development of new approaches to and new concepts of the law in keeping with and responsive to the changing needs of modern Canadian society and of individual members of that society. The Law Reform Commission reports to Parliament through the Minister of Justice.

Library of Parliament. The Library of Parliament as such was established in 1871 (SC 1871, c.21) although it existed earlier. It currently functions under RSC 1970, c.L-7. The Library of Parliament keeps all books, maps and other articles that are in the joint possession of the Senate and the House of Commons. The Parliamentary Librarian is also responsible for the Parliamentary Reading Room. Persons entitled to borrow books from the Library of Parliament are the Governor General, members of the Privy Council, members of the Senate and the House of Commons, officers of the two Houses, judges of the Supreme Court of Canada and the Federal Court of Canada, and members of the Press Gallery. In addition, books are lent to other libraries and government agencies and reference service is given to scholars. A special research branch serves parliamentarians only. The Parliamentary Librarian has the rank of a Deputy Head of a department and is responsible for the control and management of the Library under the Speaker of the Senate and the Speaker of the House of Commons assisted by a joint committee appointed by the two Houses.

Machinery and Equipment Advisory Board. The Machinery and Equipment Advisory Board, established in 1968, is responsible for considering applications for remission of duty on machinery and equipment classifiable under Tariff Items 42700-1 and/or 41100-1 and for advising the Minister of Industry, Trade and Commerce as to the eligibility of such machinery for remissions according to the provisions of these two tariff items. The Board is composed of a chairman and the Deputy Ministers of Industry, Trade and Commerce, Finance and National Revenue. It is assisted by the branches of the Department of Industry, Trade and Commerce concerned with individual industries, including machinery manufacturing. The objective of the Machinery Program, which is administered by the Board, is to increase efficiency throughout Canadian industry by enabling machinery users to acquire advanced equipment at the lowest possible cost, while at the same time affording Canadian machinery producers tariff protection on what they manufacture.

Medical Research Council. Established in 1969 and operating under authority of RSC 1970, c.M-9, the Council is a departmental Crown corporation of the federal government. It is composed of a president, a vice-president, and 20 members. The primary aim of the Council is the support and development of research in the health sciences in Canadian universities and affiliated institutions. It reports to Parliament through the Minister of National Health and Welfare.

Merchant Seamen Compensation Board. The Board is established by authority of the Merchant Seamen Compensation Act (RSC 1970, c.M-11) and reports to the Minister of Labour. The three members are appointed by the Governor in Council. The Board meets, as required, to adjudicate claims for compensation made by injured seamen employed on ships registered in Canada when they are not entitled to workmen's compensation under any provincial Workmen's Compensation Act or the Government Employees Compensation Act.

Ministry of State for Science and Technology. This Ministry was established by Order in Council PC 1971-1695 on August 11, 1971, with the primary purpose of formulating and developing policies in relation to the activities of the Government of Canada that affect the development and application of science and technology. It is organized into three principal branches - International, Policy and Domestic. The Minister of State for Science and Technology is also designated as the Minister for the Science Council Act, the Cabinet member to whom the Science Council of Canada reports.

Ministry of State for Urban Affairs. The Ministry of State for Urban Affairs was created by Proclamation, in accordance with the Government Organization Act 1970 (SC 1971, c.42), on June 30, 1971 to develop, co-ordinate, and undertake critical studies of federal policies that affect Canadians living in cities and towns.

The Ministry's task is to develop the most appropriate means by which the federal government may influence the evolution of the urbanization process in Canada; to integrate urban policy with other policies and programs of the federal government; and to foster co-operative relationships in the area of urban affairs with the provinces, and through them, with their municipalities, and with public and private organizations.

Under the direction of the Secretary and two Assistant Secretaries, the Ministry is divided into two operating wings: Policy and Research, and Co-ordination; there are also two service branches: Communications and Administration. These units contribute interdependently to fulfil the three main functions of the Ministry: policy development, co-ordination and research.

Ministry of Transport. The role and structure of the former Department of Transport were changed and a Ministry was created February 17, 1970. The new Ministry is a corporate structure of Crown corporations and operating administrations with varying degrees of autonomy, together with separate agencies for development and economic regulation. A Ministry headquarters staff supports the Minister and Deputy Minister in the functions of planning, policy formulation and assessment of program achievements in terms of the objectives of the Ministry.

The Canadian Marine Transportation Administration co-ordinates the functions of the St. Lawrence Seaway Authority, the National Harbours Board and the Marine Services components of the former Department of Transport. Its operations include management of the St. Lawrence Seaway through the St. Lawrence Seaway Authority and direct supervision of ten harbours and other facilities through the National Harbours Board; 300 public harbours and 11 others are administered by commissions under the supervision of the Ministry. It is also responsible for aids to navigation, search and rescue, nautical and pilotage services, marine agencies, steamship inspection and the Canadian Coast Guard.

The Canadian Air Transportation Administration controls and operates Canada's airways and federal airports and provides technical supervision in Canadian airspace of all aeronautical activities in the flight safety sense. These activities are conducted through the branches of Civil Aeronautics, Telecommunications and Electronics, Airports and Field Operations, Air Traffic Control, and Construction Engineering and Architectural, and the support branches of Corporate Planning, Finance and Personnel. The Canadian Air Transportation Administration also provides telecommunications and flight services to other components of the Ministry.

The Canadian Surface Transportation Administration has planning, programming and co-ordinating responsibilities relating to federal participation in the development and, where appropriate, operation of railway and highway systems, ferry services and bridges. The Administration has an ongoing interest in emerging technology in the area of new modes of surface transportation and their potential for application in new operating systems.

The recently organized Arctic Transportation Agency is responsible for developing and administering policy related to Ministry-supported transportation facilities and services in the Canadian North, in furtherance of the government's national objectives there. Intermodal relationships between air, surface and marine transportation systems are a particular concern, as well as the compatibility of these systems with economic and technological growth in the North and with the needs of the residents. In this connection there is a special relationship between the Agency and the Department of Indian Affairs and Northern Development.

The Transportation Development Agency is responsible for initiating, promoting and co-ordinating transportation research and development activities, working closely with government agencies, industry and the academic community to provide a national focus for changing technology and development opportunities in the field of transportation.

The Ministry also includes Air Canada, Canadian National Railways, and Northern Transportation Company Limited. These three Crown corporations are autonomous, maintaining close consultation with the Minister to be consistent with the government's general policies in the field of transportation. The Minister of Transport also reports to Parliament for the Canadian Transport Commission, the National Harbours Board and the St. Lawrence Seaway Authority.

Municipal Development and Loan Board. Established by the Municipal Development and Loan Act (SC 1963, c.13) to handle the financial administration of federal loans to municipalities for capital works programs, this Board is still legally in existence, but is no longer operative.

National Advisory Council on Fitness and Amateur Sport. The Council was set up under the Fitness and Amateur Sport Act (RSC 1970, c.F-25) to consider problems connected with the objectives of the Fitness and Amateur Sport Program. The Program was inaugurated in 1961 to increase the number of participants at all levels of competitive and non-competitive physical recreation and amateur sport activity ranging from day camps to the Canada and Olympic Games. The Council, consisting of not more than 30 members appointed by the Governor in Council with at least one from each province, advises the Minister of National Health and Welfare.

National Arts Centre Corporation. The Act establishing this Corporation (RSC 1970, c.N-2) was assented to July 15, 1966. The Corporation consists of a board of trustees composed of a chairman, a vice-chairman, the mayors of Ottawa and Hull, the Director of the Canada Council, the President of the Canadian Broadcasting Corporation, the Government Film Commissioner and nine other members appointed by the Governor in Council for terms not exceeding three years, except for the first appointees whose terms range from two to four years. The objects of the Corporation are to operate and maintain the National Arts Centre, to develop the performing arts in the National Capital Region and to assist the Canada Council in

the development of the performing arts elsewhere in Canada. The Corporation reports to Parliament through the Secretary of State.

National Battlefields Commission. This Commission was established by Act of Parliament in 1908 (SC 1908, cc.57-58, as amended) to preserve the Historic Battlefields at Quebec City. Composed of nine members, seven appointed by the federal government and one each by Ontario and Quebec, the Commission is supported by the federal government through annual appropriations and is responsible to Parliament through the Minister of Indian Affairs and Northern Development.

National Capital Commission. This Commission, successor to the Federal District Commission, is a Crown agency created by the National Capital Act (RSC 1970, c.N-3), proclaimed February 6, 1959. Headed by a chairman, it is made up of 20 members, representing the ten provinces of Canada, and its work force fluctuates between 600 and 850, depending on the season.

The Commission is responsible for the acquisition, development and maintenance of public lands in the National Capital Region; it co-operates with municipalities by providing planning aid or financial assistance in municipal projects of benefit to the region; and it advises the Department of Public Works on the siting and appearance of all federal government buildings in the 1,800-sq mile National Capital Region. The Commission reports to Parliament through the Minister of State for Urban Affairs.

National Council of Welfare. The National Council of Welfare consists of 21 private citizens, drawn almost equally from organizations of consumers of welfare services and from institutions involved, directly or indirectly, in the provision of welfare services. In the former category are members of low income and welfare rights groups and of organizations of native people, both Indian and Métis. In the latter category are persons involved in the social service delivery system, at both the staff and volunteer levels, and in the field of social work education.

The role of the Council is to advise the Minister of National Health and Welfare on matters related to welfare. The Office of the National Council of Welfare acts as a supportive secretariat to the Council and provides a communication and liaison link between organizations of welfare consumers and the program activities of the department.

National Design Council. The National Design Council was established by Act of Parliament in 1961 (RSC 1970, c.N-5) to promote and expedite improvement of design in the products of Canadian industry. The Council makes recommendations on design policies and the planning of programs for the furtherance of design in Canada to be implemented through departments and agencies of the federal government, regional governments and other private and institutional bodies. Programs formally recognized by the Council are identified under the title of "Design Canada". The Council has 17 members appointed by the Governor in Council and reports through its chairman to the Minister of Industry, Trade and Commerce.

National Energy Board. This Board was established under the National Energy Board Act, 1959 (RSC 1970, c.N-6) for the purpose of assuring the best use of energy resources in Canada. The Board, composed of seven members, is responsible for regulating the construction and operation of the oil and gas pipelines that are under the jurisdiction of the Parliament of Canada, the tolls charged for transmission by oil and gas pipelines, the export and import of gas and the import of motor gasoline and motor gasoline-blending components, the export of electric power, and the construction of the lines over which power is exported or imported. The Board is also required to study and keep under review all matters relating to energy under the jurisdiction of the Parliament of Canada and to recommend such measures as it considers necessary and advisable on the subject. The Board reports to Parliament through the Minister of Energy, Mines and Resources.

National Farm Products Marketing Council. This Council was established in 1972 under the National Farm Products Marketing Agencies Act (SC 1972, c.65). The Council consults with producers, commodity boards, and provincial and federal governments and co-ordinates their views on the establishment and operation of national marketing agencies. It assists and supervises the operations of agencies and promotes more effective marketing of farm products in interprovincial and export trade. The goal is to maintain and promote an efficient, competitive and expanding agricultural industry.

The Council consists of a chairman, a vice-chairman, two full-time and two part-time members, appointed by the Governor in Council and is directly responsible to the Minister of Agriculture. Council headquarters is in Ottawa.

National Film Board. The National Film Board, established in 1939, operates under the National Film Act (RSC 1970, c.N-7) which provides for a board of governors of nine members — a Government Film Commissioner, appointed by the Governor in Council, who is chairman of the Board, three members from the Public Service of Canada and five members from outside the Public Service. The Board reports to Parliament through the Secretary of State. The Board is responsible for advising the Governor in Council on film activities and is authorized to produce and distribute films in the national interest and, in particular, films "designed to interpret Canada to Canadians and to other nations". The Board is responsible for the production and processing of films for government departments. Its head office is located in Ottawa and its operations are carried out in Montreal.

National Harbours Board. The Board was established by Act of Parliament in 1936 (RSC 1970, c.N-8). It is responsible for the administration of port facilities at the harbours of St. John's, Nfld.; Halifax, NS; Saint John and Belledune, NB; Chicoutimi, Quebec, Trois-Rivières and Montreal, Que.; Churchill, Man.; Vancouver and Prince Rupert, BC; the Jacques Cartier and Champlain bridges at Montreal, Que.; and the grain elevators at Prescott and Port Colborne, Ont. The Board reports to Parliament through the Minister of Transport.

National Library. The National Library came formally into existence on January 1, 1953, with the proclamation of the National Library Act (RSC 1970, c.N-11). It publishes *Canadiana*, a monthly catalogue of new publications relating to Canada, with an annual cumulation. The Library also publishes other bibliographies. Its Reference Branch maintains the Canadian Union Catalogue which embodies the author catalogues of the major libraries in the ten provinces and is thus a key to the book collections of the whole country. The Library's own book stock totals more than 400,000 volumes. The National Librarian reports to Parliament through the Secretary of State.

National Museums of Canada. The National Museums of Canada is a departmental Crown corporation established April 1, 1968, by the National Museums Act (RSC 1970, c.N-12). The corporation was established to join under one administration the four existing museum activities: the National Gallery of Canada; the National Museum of Man (including the Canadian War Museum); the National Museum of Natural Sciences; and the National Museum of Science and Technology (including the National Aeronautical Collection). The corporation reports to Parliament through the Secretary of State.

The board of trustees is composed of a chairman, a vice-chairman, an executive committee of five and seven additional board members. All these members of the board are appointed by Governor in Council for fixed terms of office. In addition there are two ex-officio members, the Director of the Canada Council and the President of the National Research Council.

The purposes of the corporation, according to the Act, are "to demonstrate the products of nature and the works of man, with special but not exclusive reference to Canada, so as to promote interest therein throughout Canada and to disseminate knowledge thereof". To these ends the corporation is empowered to: collect, classify, preserve and display objects relevant to its purposes; undertake or sponsor research relevant to its purposes; arrange for and sponsor travelling exhibitions of materials in, or related to, its collections; arrange for the publication or acquisition and the sale to the public of books, pamphlets, replicas and other materials related to its purposes; undertake or sponsor programs for the training of persons in the professions and skills involved in the operation of museums; arrange for or provide professional and technical services to other organizations whose purposes are similar to any of those of the corporation on such terms and conditions as may be approved by the Minister; and generally, do and authorize such things as are incidental or conducive to the attainment of the purposes of the corporation and the exercise of its powers.

National Parole Board. The National Parole Board was established in January 1959 by the Parole Act (RSC 1970, c.P-2), which gives it absolute authority for parole of inmates under sentence of imprisonment imposed under an Act of Parliament or for criminal contempt of court. Under the Act the Board has jurisdiction over all matters of federal parole, except for commuted death sentences for capital or non-capital murder. In such cases eligibility is possible after ten years but consent for eligibility and for release on parole must come from the Governor in Council. The Board is composed of a chairman and eight other members appointed by Order in Council for ten years. The Board reports to Parliament through the Solicitor General of Canada.

National Research Council of Canada. This is an agency of the federal government established in 1916 to promote scientific and industrial research. The Council operates science and engineering laboratories in Ottawa, Halifax and Saskatoon; gives direct financial support to research carried out in Canadian university and industrial laboratories; sponsors associate committees co-ordinating research on specific problems of national interest; and develops and maintains the nation's primary physical standards. The federal government has designated NRC as the co-ordinating body for the further development of a national scientific and technical information system under the general direction of the National Librarian. Other activities include the provision of free technical information to manufacturing concerns; the publication of research journals; and representation of Canada in International Scientific Unions. Patentable inventions developed in the Council's laboratories are made available for manufacture through a subsidiary company, Canadian Patents and Development Limited. The National Research Council consists of a president, three vice-presidents and 17 members representing Canadian universities, industry and labour. The Council is incorporated under the National Research Council Act (RSC 1970, c.N-14) and reports to Parliament through a designated Minister, at present the President of the Treasury Board.

New Brunswick Multiplex Corporation. This Corporation was established under the terms of a formal agreement between the federal and provincial governments on February 2, 1971. The object of the Corporation is to develop preliminary plans for the creation of a metal-working industrial complex centred in Saint John, NB. The Corporation reports to Parliament through the Minister of Regional Economic Expansion.

Northern Canada Power Commission. The Commission was established by Act of Parliament in 1948 (RSC 1970, c.N-21) to provide power to points in the Northwest Territories where a need developed and where power could be supplied on a self-sustaining basis; the Act was amended in 1950 to give the Commission authority to provide similar services in the Yukon Territory. The name of the Commission (formerly the Northwest Territories Power Commission) was changed in 1956. It is composed of a chairman and two members appointed by the Governor in Council and reports to Parliament through the Minister of Indian Affairs and Northern Development.

Northern Transportation Company Limited. This Company was incorporated in 1947 under the title of Northern Transportation Company (1947) Limited, the date being omitted from the name in 1952. Previously a company chartered under an Alberta statute, it has been a wholly owned subsidiary of Eldorado Nuclear Limited since that Crown company was established and carries out the business of a common carrier in the Mackenzie River watershed and the western Arctic. The Company is responsible to Parliament through the Minister of Transport.

Office of the Auditor General. This Office originated in 1878 and currently functions under the Financial Administration Act (RSC 1970, c.F-10). The Auditor General is responsible for examining accounts relating to the Consolidated Revenue Fund and to public property, and for reporting annually to the House of Commons the results of his examinations. He also audits the accounts of various Crown corporations and other organizations. The Minister of Finance acts as spokesman in Parliament for the Auditor General.

Office of the Chief Electoral Officer. This Office was established in 1920 under the provisions of the Dominion Elections Act, now the Canada Elections Act (RSC 1970, c.14, 1st Supp.), and is responsible for the conduct of all federal elections as well as the elections of members of the Northwest Territories Council and of the Yukon Territory Council. In addition, it conducts any vote taken under the Canada Temperance Act. The Chief Electoral Officer is responsible directly to the House of Commons, the President of the Privy Council acting as spokesman for him in the Cabinet.

Office of the Custodian of Enemy Property. Under the Trading with the Enemy (Transitional Powers) Act (SC 1947, c.24), the Custodian is responsible for all enemy property reported to him, received or controlled by him or vested in him by virtue of the Regulations. After the war, enemy assets vested in the Custodian are either confiscated, liquidated and the proceeds used to pay compensation to Canadians in respect of war claims, or released to their former owners, in accordance with postwar statutes and Orders in Council adopted pursuant to peace treaties and other international agreements.

The Minister of Supply and Services is the Custodian of Enemy Property.

Office of the Representation Commissioner. The Office was established in 1963 under the provisions of the Representation Commissioner Act (RSC 1970, c.R-6). After each decennial census, the Representation Commissioner is responsible for preparing maps showing the distribution of population in each province and setting out alternative proposals respecting the boundaries of electoral districts in each province. These maps are supplied to the ten electoral boundaries commissions (one for each province) established under the provisions of the Electoral Boundaries Readjustment Act (RSC 1970, c.E-2). The Representation Commissioner is a member of each of the ten commissions. The Secretary of State acts as spokesman for the Office in the Cabinet and the House of Commons.

Panarctic Oils Limited. This corporation is a consortium of oil and gas companies, individuals and the federal government formed in 1967 to explore for oil and gas in the Arctic area. Panarctic Oils Ltd. is not a Crown corporation and does not report to Parliament.

Pension Appeals Board. This Board, established under the Canada Pension Plan Act (RSC 1970, c.C-5) hears appeals under the Canada Pension Plan and under certain provincial pension plans. The Board consists of a judge of the Federal Court of Canada or of a superior court of a province appointed as chairman and not less than two and not more than five other persons, each of whom must be a judge of the Federal Court or of a superior, district or county court of a province. For purposes of appeals under the Canada Pension Plan, the Board reports to Parliament through the Minister of National Health and Welfare.

Pension Review Board. The Pension Review Board was created under the Minister of Veterans Affairs by the amendments to the Pension Act 1971 (SC 1970-71, c. 31). Composed of a chairman and four other members, the Board is an independent and autonomous body that hears appeals from pension applicants dissatisfied with decisions of an Entitlement Board or two members of the Canadian Pension Commission. The Board is also the responsible body when matters of interpretation of the Acts are at issue.

Pilotage Authorities. The Pilotage Act (SC 1971, c.52) established the Atlantic Pilotage Authority, the Laurentian Pilotage Authority, the Great Lakes Pilotage Authority and the Pacific Pilotage Authority as proprietary corporations as specified in Schedule D of the Financial Administration Act. The objects of each Authority are to establish, operate, maintain and administer in the interests of safety an efficient pilotage service within the region set out in respect of the Authority. Each of the four Authorities has a

chairman and not more than six other members appointed by the Governor in Council for a term not exceeding ten years. The Pilotage Authorities report to Parliament through the Minister of Transport.

Post Office Department. Administration and operation of the Canada Post Office, by virtue of the Post Office Act (RSC 1970, c.P-14) and under the Postmaster General, includes all phases of postal activity, personnel, mail handling, transportation of mails by land, water, rail and air and the direction and control of financial services including the operation of the money order service.

The Department's headquarters is located in Ottawa, with regional headquarters in Halifax, Montreal, Toronto and Vancouver. District offices are located in St. John's, Halifax, Saint John, Quebec City, Montreal, Ottawa, North Bay, Toronto, London, Winnipeg, Saskatoon, Edmonton and Vancouver.

Prairie Farm Rehabilitation Administration (PFRA). The PFRA was established in 1935 (RSC 1952, c. 214) to assist in the rehabilitation of agricultural lands seriously affected by drought and soil drifting in Manitoba, Saskatchewan and Alberta. Since then it has turned 2.5 million acres of marginal and submarginal land into community pastures and has been instrumental in the construction of many large irrigation and water-control projects. At the farm level, the PFRA has assisted 100,000 dugout projects for irrigation, stock-watering and domestic water supplies. It has also distributed up to 10 million seedlings a year for farm shelterbelts. As an entity within the Department of Regional Economic Expansion, the PFRA has the additional responsibility of implementing departmental programs in Alberta, Saskatchewan and Manitoba.

Preparatory Commission for Metric Conversion (Metric Commission). This Commission was established by Order in Council PC 1971-1146, June 1971. It consists of a full-time chairman and up to 20 part-time commissioners all of whom are appointed by the Governor in Council for a term of three years. An executive director acts for the Commission in directing the full-time staff.

The Commission advises the Minister of Industry, Trade and Commerce on plans for conversion to the metric system and on the need for legislation. It also initiates, co-ordinates and undertakes investigations, surveys and studies relating to the implications of conversion to the metric system in different sectors of the Canadian economy. It prepares, in consultation and co-operation with any department or agency of the Government of Canada and of any province, the Standards Council of Canada, or other interested parties, an over-all program for conversion to the metric system which will ensure, as far as possible, that any programs are phased and co-ordinated in order to maximize the benefits of conversion while minimizing the costs. The Commission also furnishes, publishes and disseminates information concerning conversion to the metric system.

Privy Council Office. For administrative purposes, the Privy Council Office is regarded as a department of government under the Prime Minister. The Clerk of the Privy Council, under whose direction its functions are carried out, is considered as a Deputy Head and takes precedence among the chief officers of the Public Service. The authority of the Privy Council Office is to be found in Sections 11 and 130 of the British North America Act, 1867, which constituted a Council to aid and advise in the Government of Canada to be styled the Queen's Privy Council for Canada. In 1940, with the wartime development of Cabinet committees and the consequent need for orderly secretarial procedures such as agenda, explanatory memoranda and minutes, the Principal Secretary in the Prime Minister's Office was designated Clerk of the Privy Council and Secretary to the Cabinet. Since 1946, the Privy Council Office has been further reorganized, developed and enlarged and certain administrative functions of the Privy Council Office and the Prime Minister's Office have been closely integrated in the interests of efficiency and economy.

The organization of the Privy Council Office at present consists primarily of the Cabinet Secretariat with the following divisions reporting to the Clerk of the Privy Council and Secretary to the Cabinet: Deputy Secretary to the Cabinet (Operations); Deputy Secretary to the Cabinet (Plans); and Deputy Secretary to the Cabinet (Federal-Provincial Relations). Within the Privy Council Office, submissions to the Governor in Council are received, draft orders and regulations prepared, approved Orders are circulated and, in addition, the duties of editing, registering and publishing the federal statutory regulations in Part II of the *Canada Gazette* are carried out. The various secretaries deal with secretarial work for the Cabinet and for Cabinet committees and interdepartmental committees. This involves the preparation and circulation of agenda and necessary documents to Ministers and recording and circulating decisions; liaison with departments and agencies of the government; and the preparation of material for the Prime Minister.

The Office of the Prime Minister is organized as a Secretariat associated with the Privy Council Office and includes members of the Prime Minister's personal staff responsible for arranging the release of the Prime Minister's statements on matters of public interest, his public appearances and appointments to interview him. They also handle general secretarial business, draft letters and assist the Prime Minister in his Parliamentary duties.

Public Archives. The Public Archives was founded in 1872 and is administered under the Public Archives Act (RSC 1970, c.P-27) by the Dominion Archivist who has the rank of a Deputy Minister and reports to Parliament through the Secretary of State. Its purpose is to assemble and make available to the public a comprehensive collection of source material relating to the history of Canada. It also has broad

responsibilities in regard to the promotion of efficiency and economy in the management of the federal government records. The Historical Branch, located in the National Library and Archives Building, is a centre for research on the development of Canada. In addition to the selected records of the federal government, it possesses an extensive collection of private papers of individuals and societies, a map collection which is the most important of its kind in the country, and an extensive collection of paintings, drawings, prints, photographs, sound recordings and films relating to Canada. A specialized library is also at the disposal of searchers. The Records Management Branch operates a large Records Centre in Ottawa and regional centres in Toronto, Montreal and Vancouver where non-current departmental records are centralized, stored and serviced. It assists departments in their records management programs. The Administration and Technical Services Branch operates the Central Microfilm Unit for the several departments of government.

Under the terms of the Laurier House Act (RSC 1952, c.163), the Public Archives is responsible for the administration of Laurier House as a museum.

Public Service Commission. Arrangements were made for civil service appointments under the first Civil Service Act of 1868 but the first Civil Service Commission was not created until 1908. This established the beginnings of the merit system which is today the cornerstone of personnel administration in the Public Service. The Act of 1918 gave the Commission authority to control recruitment, selection, appointment, classification and organization and to recommend rates of pay. The next Civil Service Act, passed in 1961, strengthened the principles of the merit system, clarified the Commission's role in other areas of personnel administration, and gave the staff associations the right to be consulted on matters about remuneration and conditions of employment.

The Public Service Employment Act (RSC 1970, c.P-32) which came into force on March 13, 1967, redefined the Commission's role as the central staffing agency and extended its authority to the Public Service, covering certain groups of employees exempt from the previous Acts. The Public Service is specified in Schedule A of the Public Service Staff Relations Act. It does not include Crown corporations, such as the Canadian Broadcasting Corporation, the Central Mortgage and Housing Corporation, the Canadian National Railways and Air Canada. The new Act also reaffirms the merit principle, at the same time permitting delegation of the Commission's authority, although not its responsibility to Parliament. Under the Act, the Commission is relieved of responsibility for recommending rates of pay and conditions of service to the government, for classification, and for consultation with staff associations on matters that are now the subject of collective bargaining.

On November 9, 1972, the Commission was assigned the duty, by Order in Council PC 1972 - 2569, of investigating cases of alleged discrimination on grounds of sex, race, national origin, colour or religion with respect to the application and operation of the Public Service Employment Act, and an Investigation Branch has been established for this purpose.

The Public Service Commission reports directly to Parliament. The Secretary of State has traditionally been the Minister who presents the Commission's report to the House of Commons.

Public Service Staff Relations Board. Established in 1967 by the Public Service Staff Relations Act (SC 1967, c.72), the Board is an independent body which is responsible for determining bargaining units, certifying bargaining agents, dealing with complaints of unfair practices and generally overseeing the administration of the legislation providing for collective bargaining in the Public Service of Canada. The Board consists of a full-time chairman and vice-chairman who hold office for a period of ten years and up to eight part-time members, equally representative of the interests of employees and the interests of the employer, who hold office for seven years. Under the Act, the Public Service Staff Relations Board reports to Parliament, through such Minister of the Crown, other than a member of the Treasury Board, as may be designated by the Governor in Council. At present the Board reports through the President of the Privy Council.

Queen Elizabeth II Canadian Research Fund. The Queen Elizabeth II Canadian Research Fund Act (SC 1959, c.33) established the Fund of \$1 million to be administered by a board of trustees to aid in research on the diseases of children. The Prime Minister reports to Parliament on the operations of the Fund.

Restrictive Trade Practices Commission. The Restrictive Trade Practices Commission, domiciled in the Department of Consumer and Corporate Affairs, is responsible under the Combines Investigation Act (RSC 1970, c.C-23) for appraising evidence submitted to it by the Director of Investigation and Research and the parties under investigation, holding hearings and making reports to the Minister.

Roosevelt Campobello International Park Commission. Established by the Roosevelt Campobello International Park Commission Act (SC 1964/65, c.19), the Commission consists of six members, three appointed by the Government of Canada and three by the Government of the United States to administer the Roosevelt Campobello International Park, at Campobello, NB. The Canadian section of the Commission reports to Parliament through the Secretary of State for External Affairs.

Royal Canadian Mint. The Royal Canadian Mint has been in operation since 1908. It was first established as a branch of the Royal Mint under the (Imperial) Coinage Act of 1870, and opened on January 2, 1908. On December 1, 1931, it became the Royal Canadian Mint and operated as a branch of the Department of

Finance. In 1969, the Mint became a Crown agency corporation, reporting to Parliament through the Minister of Supply and Services. It operates under authority of RSC 1970, c.R-8.

The latter change was made to provide for a more industrial type of organization and for flexibility in producing coins of Canada and other countries; buying, selling, melting, assaying and refining gold and other precious metals; and producing metals, plaques and other devices. The Mint has a seven-man board of directors appointed by the Governor in Council — the Master of the Mint who is its chief executive officer appointed to serve during pleasure, the chairman who is appointed for a four-year period, subject to re-appointment, and five other directors, two from inside and three from outside the Public Service, who are appointed for terms of three years. The Mint now operates basically as a manufacturing enterprise, with the object of making a small profit. Financial requirements are provided through loans from the Consolidated Revenue Fund.

Royal Canadian Mounted Police. The Royal Canadian Mounted Police, a civil force maintained by the federal government, was organized in 1873 as the North-West Mounted Police. It now operates under the Royal Canadian Mounted Police Act (RSC 1970, c.R-9) and is responsible for enforcing federal laws throughout Canada. By agreement with the governments of eight provinces (all provinces except Ontario and Quebec) it is also responsible for enforcing provincial laws within those provinces and for policing many district municipalities, cities and towns. In the Yukon Territory and Northwest Territories the RCMP provides law enforcement services under contracts with the territorial governments. A Commissioner, appointed by the Governor in Council, has the control and management of the Force and of all matters connected therewith; he functions under the direction of the Solicitor General of Canada.

St. Lawrence Seaway Authority. The St. Lawrence Seaway Authority was established by Act of Parliament in 1951 (RSC 1970, c.S-1) and came into force by proclamation on July 1, 1954. The Authority was incorporated for the purposes of constructing, maintaining and operating all such works as may be necessary to provide and maintain, either wholly in Canada or in conjunction with works undertaken by an appropriate authority in the United States, a deep waterway between the Port of Montreal and Lake Erie. The Crown corporation, Seaway International Bridge Corporation Limited, is subsidiary to the St. Lawrence Seaway Authority. The Authority is composed of a president, a vice-president and a member, and reports to Parliament through the Minister of Transport.

Science Council of Canada. The Science Council of Canada was established in 1966 (RSC 1970, c.S-5) and became a Crown corporation on April 1, 1969. The Council consists of 25 members each having a specialized interest in science or technology and four associate members chosen from among officers or employees of the federal government. Members hold office for terms of not more than three years and associate members hold office during pleasure. All are appointed by the Governor in Council. The duties of the Science Council are to assess in a comprehensive manner Canada's scientific and technological resources, requirements and potentialities and to make recommendations thereon. The Council reports to Parliament through a designated Minister, at present the Minister of State for Science and Technology.

Seaway International Bridge Corporation Limited. The Seaway International Bridge Corporation Limited was established under the Companies Act, by Letters Patent, November 13, 1962. It operates the international toll bridges system between Cornwall, Ont. and Roosevelttown, NY on behalf of the owners, the St. Lawrence Seaway Authority and the Saint Lawrence Seaway Development Corporation. It reports to Parliament through the Minister of Transport.

Secretariat of the Interdepartmental Committee on the 1976 Olympic Games. This Secretariat was established by Cabinet to co-ordinate all federal activities related to the 1976 Olympic Games. The Committee performs a liaison function with the Olympic Games Organization Committee (COJO), the cities of Montreal and Kingston, and the Quebec and Ontario governments; it ensures that appropriate federal departments and agencies are informed of and prepared to evaluate requests from COJO for federal assistance within the framework of government policy. In addition, the Committee is responsible for expediting the preparation of necessary legislation and regulations, and for keeping Cabinet informed about federal involvement in Olympic preparations.

Standards Council of Canada. The Council was established by Act of Parliament (RSC 1970, c.41, 1st Supp.) which received Royal Assent on October 7, 1970. Its objectives are to foster and promote voluntary standardization in fields relating to the construction, manufacture, production, quality, performance and safety of buildings, structures, manufactured articles and products and other goods, including components thereof, not expressly provided for by law, as a means of advancing the national economy, benefiting the health, safety and welfare of the public, assisting and protecting consumers, facilitating domestic and international trade and furthering international co-operation in the field of standards. The Council is responsible for co-ordinating the planning and execution of a program for the development of standards in the metric (SI) system. This activity is in support of the over-all program which is being developed by the Preparatory Commission for Metric Conversion.

The Council consists of not more than 57 members, of whom six are federal representatives, ten represent the provinces and 41, various national organizations. Membership is broadly representative of all levels of government, primary and secondary industries, distributive and service industries, trade

associations, labour unions, consumer associations and the academic community. The Council reports to Parliament through the Minister of Industry, Trade and Commerce.

Statistics Canada. Statistics Canada became the new name for the Dominion Bureau of Statistics with the proclamation of a new Statistics Act (SC 1971, c.15) on May 1, 1971. The Bureau was initially set up by statute in 1918 as the central statistical agency for Canada (SC 1918, c.43). In 1948 this statute, which had been consolidated as the Statistics Act (RSC 1927, c.190), was repealed and replaced by the Statistics Act (RSC 1952, c.257) which was amended by SC 1952-53, c.18, assented to March 31, 1953. The 1971 Act replaces that statute.

The functions of Statistics Canada are to compile, analyze and publish statistical information relative to the commercial, industrial, financial, social and general condition of the people and to conduct regularly a census of population and agriculture of Canada as required under the Act.

Statistics Canada is a major publication agency of the federal government; its reports cover all aspects of the national economy and social conditions of the country. The administrative head of the bureau is the Chief Statistician of Canada who has the rank of a Deputy Head of a department and reports to Parliament through the Minister of Industry, Trade and Commerce.

Tariff Board. Constituted in 1931, the Board derives its duties and powers from four statutes: the Tariff Board Act (RSC 1970, c.T-1); the Customs Act (RSC 1970, c.C-40); the Excise Tax Act (RSC 1970, c.E-13); and the Anti-dumping Act (RSC 1970, c.A-15).

Under the Tariff Board Act, the Board makes inquiry into and reports on any matter in relation to goods that, if brought into Canada, are subject to or exempt from customs duties or excise taxes. Reports of the Board are tabled in Parliament by the Minister of Finance. It is also the duty of the Board to inquire into any other matter in relation to the trade and commerce of Canada that the Governor in Council sees fit to refer to the Board.

Under the provisions of the Customs Act, the Excise Tax Act and the Anti-dumping Act, the Tariff Board acts as a court to hear appeals from decisions of the Department of National Revenue. Customs and Excise, in respect of excise taxes, tariff classification, value for duty, drawback of customs duties and determination of normal value or export price in dumping matters. Declarations of the Board on appeals are final and conclusive but the Acts contain provisions for appeal on questions of law to the Federal Court and thence to the Supreme Court of Canada.

Tax Review Board. The Tax Review Board, created in 1949 as the Income Tax Appeal Board and later changed to the Tax Appeal Board, now operates under the Tax Review Board Act 1970 (SC 1970-71, c.11). The Board is declared by statute to be a court of record and has jurisdiction to hear appeals by taxpayers against their assessment under the Income Tax Act and also appeals under the Estate Tax Act, the Old Age Security Act and certain sections of the Canada Pension Plan. An appeal lies from the Board to the Federal Court of Canada and a further appeal from that court to the Supreme Court of Canada. The Board consists of a chairman, an assistant chairman and three other members. Its offices are located at Ottawa and it hears appeals at 28 centres throughout Canada as required and at the main centres, such as Montreal, Toronto and Vancouver, several times a year. The Board is under the jurisdiction of the Minister of Justice but is independent of the Department of Justice.

Telesat Canada. Telesat Canada was incorporated in 1969 by an Act of Parliament (RSC 1970, c.T-4). Its objectives are to establish satellite telecommunication systems providing telecommunication services on a commercial basis. The recommendations of a government task force on satellite policy and the use of satellite technology for domestic communications appointed in 1967 and a 1968 White Paper based to a large extent on those recommendations preceded the establishing legislation.

The authorized capital of the corporation consists of 10 million common shares without par value and 5 million preferred shares with a par value of \$10 per share. At the end of 1972, there were 6 million common shares issued and outstanding. The corporation will ultimately be owned by three main groups of shareholders: the federal government, the telecommunications common carriers and the general public. Currently, the corporation is owned by the first two groups.

Telesat is not a Crown corporation, nor is it an agent of Her Majesty. Its annual report is tabled in the House of Commons by the Minister of Communications.

Textile and Clothing Board. This Board was established by SC 1971, c.39 to receive complaints and conduct inquiries about textile and clothing goods imported into Canada under such conditions as to cause or threaten serious injury to Canadian production. After its investigative procedures are completed, the Board makes written recommendations to the Minister of Industry, Trade and Commerce. The Board consists of three members appointed by the Governor in Council and maintains its head office in the National Capital Region.

Treasury Board. The Treasury Board was first established as a committee of the Queen's Privy Council for Canada by Order in Council PC 3 of July 2, 1867, and was made a statutory committee in 1869. The Minister of Finance was appointed Chairman of the Board, with four other Privy Counsellors to be designated as members by the Governor in Council. The Secretary of the Board and the members of his staff were employed by the Department of Finance.

By the Government Organization Act, 1966 (SC 1966, c.25) the Board Secretariat was established as a separate department of government with its own Minister, the President of the Treasury Board. The committee constituting the Treasury Board includes, in addition to the President, the Minister of Finance and four other Privy Councillors.

The Financial Administration Act (RSC 1970, c.F-10), defines the Treasury Board's responsibilities as the central management agency of government. These responsibilities include the organization of the Public Service, financial management, long-term expenditure planning, and expenditure control, including allocation of resources among departments and agencies of government; management of personnel functions in the Public Service; and improvement in the efficiency of management and administration in the Public Service.

The staff of the Treasury Board is divided into four branches. The Administrative Policy Branch is responsible for the development, interpretation, dissemination and evaluation of policies, guidelines and regulations in administrative areas, including the financial management systems needed to provide for adequate visibility and accountability, and other administrative inputs to government operations such as accommodation, travel, contracting, electronic data processing, etc., with a view to ensuring probity and prudence in the acquisition of administrative inputs as well as their effective and efficient use in support of departmental programs. The Planning Branch is responsible for the development and application of systems and procedures for evaluating the effectiveness and efficiency of programs and projects and for providing advice and planning assistance for organizational change in government. The Personnel Policy Branch is responsible for all matters relating to personnel management in the Public Service including manpower requirements, manpower development and training, classification, compensation benefits, representing the government in collective bargaining with bargaining agents representing employees in the Public Service, and implementation of the government's objectives in bilingual matters as these affect the Public Service. The Program Branch is responsible for such matters as the financial management functions of short- and long-range expenditure forecasting, program analysis, expenditure control and estimates preparation.

The Secretariat of the Interdepartmental Committee on the 1976 Olympic Games reports to Parliament through the President of the Treasury Board, who is also the designated Minister responsible for the National Research Council and Canadian Patents and Development Limited.

Unemployment Insurance Commission. The Commission was established under the provisions of the Unemployment Insurance Act, 1940 (RSC 1970, c.U-2); the Act was revised in 1955 and again in 1971. It administers the Unemployment Insurance Act and performs other duties which the Minister of Manpower and Immigration may require.

The function of the Commission is to provide employed persons with insurance and, subject to regulations, make weekly payments to them for a limited time during periods of unemployment. Under the 1971 legislation, about 1.2 million more people are covered; only eight weeks of insured employment are required to qualify for some benefits; and under certain conditions an interruption of earnings caused by sickness or maternity can be covered. Minimum and maximum weekly benefits rates are fixed by the Act. Services of the Commission were also expanded to include a Claimant Assistance Program to help people become re-employed.

Three commissioners, consisting of the chairman who is chief executive officer, one commissioner representing employed persons and one representing employers, operate the Commission. It functions at three levels — head office in Ottawa, five regional offices and a number of district and other offices across the country. The Commission reports to Parliament through the Minister of Manpower and Immigration.

Uranium Canada, Limited. This Crown company, incorporated in June 1971 under the Canada Corporations Act (RSC 1970, c.C-32) pursuant to the Atomic Energy Control Act (RSC 1970, c.A-19), is an agency corporation under Schedule C of the Financial Administration Act (RSC 1970, c.F-10). It is for all its purposes an agent of Her Majesty and its powers may be exercised only as an agent of Her Majesty. The shares of the company, with the exception of the qualifying shares of the directors, are held by the Minister of Energy, Mines and Resources. Registered under the trade mark UCAN, the company is responsible to act as an agent on behalf of the federal government with respect to the acquisition and future sales of the joint stockpile of uranium concentrates established under the agreement with Denison Mines Limited, entered into January 1, 1971. Denison Mines Limited acts as the sales agent for the concentrates in the joint stockpile including negotiating for and endeavouring to secure contracts with customers. UCAN also acts as the agent on behalf of the federal government for future sales from the general government stockpile. The corporation's head office is in Ottawa.

War Veterans Allowance Board. This Board, established under the authority of the War Veterans Allowance Act, 1930 (RSC 1970, c.W-5) is a quasi-judicial body consisting of ten members, including a chairman and a deputy chairman, appointed by the Governor in Council. The Board administers the War Veterans Allowance Act and Part XI of the Civilian War Pensions and Allowances Act. Its functions include the responsibility of ensuring that the 19 district authorities, located in various regions throughout Canada, interpret the legislation in a fair, reasonable and equitable manner. The War Veterans Allowance Board is also an appeal body which may consider appeals against the decision of a district authority. It reports to Parliament through the Minister of Veterans Affairs.

Appendix 2

Synopsis of legislation passed in 1972

Synopsis of legislation of the fourth session of the twenty-eighth Parliament, February 17, 1972 to September 1, 1972 passed in the twenty-first year of the reign of Her Majesty Queen Elizabeth II

Chapter 1 (March 29) *Appropriation Act No. 1, 1972* grants certain sums of money for the public service for the financial year ending March 31, 1972.

Chapter 2 (March 29) *Appropriation Act No. 2, 1972* grants certain sums of money for the public service for the financial year ending March 31, 1973.

Chapter 3 (March 29) *An Act respecting the Electoral Boundaries Readjustment Act* changes the name of the electoral district of "Essex" in Ontario to "Essex-Windsor".

Chapter 4 (March 29) *An Act respecting the Electoral Boundaries Readjustment Act* changes the name of the electoral district of "High Park" in Ontario to "High Park-Humber Valley".

Chapter 5 (March 29) *An Act respecting the Electoral Boundaries Readjustment Act* changes the name of the electoral district of "Renfrew North" in Ontario to "Renfrew North-Nipissing East".

Chapter 6 (March 29) *An Act respecting the Electoral Boundaries Readjustment Act* changes the name of the electoral district of "Témiscouata" in Quebec to "Rivière-du-Loup-Témiscouata".

Chapter 7 (March 29) *An Act respecting the Electoral Boundaries Readjustment Act* changes the name of the electoral district of "Trois-Rivières" in Quebec to "Trois-Rivières-Métropolitain".

Chapter 8 (March 29) *The Federal-Provincial Fiscal Arrangements Act, 1972* authorizes payments to provinces respecting revenue equalization, revenue stabilization, tax revenue guarantees, certain corporation income taxes collected on behalf of a province, and post-secondary education adjustments; authorizes income tax collection agreements with the provinces; and extends for an additional five years the hospital insurance program and the special welfare program under the Established Programs (Interim Arrangements) Act.

Chapter 9 (March 29) *An Act to amend the Income Tax Act* permits certain additional deductions from the income tax payable for the 1972 taxation year by individuals and for the 1972 or 1973 taxation year by corporations.

Chapter 10 (May 19) *An Act to amend the Old Age Security Act* reduces the residence requirements of pensioners residing outside Canada; fixes the basic amount of the monthly pension at \$80 per month; increases the maximum amount of the guaranteed income supplement effective January 1, 1972; and provides for an annual adjustment of both amounts to reflect the full amount of any increase in the Consumer Price Index, with no decrease in a year where there is a decrease in the Index.

Chapter 11 (May 19) *An Act respecting the use of the expression "Parliament Hill"* prohibits the use of the words "Parliament Hill" by any person to describe or designate a property, place, site or location other than the area in the city of Ottawa bounded by Wellington Street, the Rideau Canal, the Ottawa River and Bank Street; to identify any goods, merchandise, wares or articles for commercial use or sale; or in association with a commercial service-rendering establishment.

Chapter 12 (May 19) *An Act to amend the Pension Act, the War Veterans Allowances Act, the Civilian War Pensions and Allowances Act, the Children of War Dead (Education Assistance) Act and the Department of Veterans Affairs Act* provides for the annual adjustment of pensions and allowances to reflect any increase in the Consumer Price Index, with no decrease in a year where there is a decrease in the Index.

Chapter 13 (June 15) *The Criminal Law Amendment Act, 1972* makes hijacking of an aircraft and endangering safety of aircraft in flight or rendering it incapable of flight specific offences punishable by life imprisonment, and the taking on board a civil aircraft of an offensive weapon or explosive substance a specific offence punishable by imprisonment for 14 years; and includes a wide range of amendments in existing provisions of the Criminal Code and related amendments to the Criminal Code 1967 Amendment Act, the Criminal Records Act, the National Defence Act, the Parole Act and the Visiting Forces Act.

Chapter 14 (June 30) *An Act to amend the Adult Occupational Training Act* permits any person who has not attended school on a regular basis for any period of at least 12 months since attaining regular school leaving age to be enrolled in an occupational training course; authorizes contracts with an employer or a group or association of employers for an occupational training course for its employees; and provides that a province or an employer may be reimbursed for the cost of providing training. The Act also removes certain eligibility requirements to receive training allowances.

Chapter 15 (June 30) *Appropriation Act No. 3, 1972* grants certain sums of money for the public service for the financial year ending March 31, 1973.

Chapter 16 (June 30) *An Act to amend the Canadian Wheat Board Act* provides that the amount to be paid for wheat is to be determined in respect of a base grade, that the amount payable to a producer for wheat may be fixed so as to reflect quality within a grade, and extends the application of the Act to grains other than wheat.

Chapter 17 (June 30) *The Territorial Supreme Courts Act* changes the name of the Territorial Court of the Yukon Territory to the Supreme Court of the Yukon Territory and the name of the Territorial Court of the Northwest Territories to the Supreme Court of the Northwest Territories.

Chapter 18 (July 7) *An Act to amend the Canada Labour Code* amends the Code respecting industrial relations. It continues the Canada Labour Relations Board, provides for Industrial Inquiry Commissions and conciliation boards and, where provincial and federal legislation are substantially uniform, for an agreement with a province re the administration of provincial legislation. It also provides for such tenure, remuneration and expenses as may be necessary for the carrying out of these provisions.

Chapter 19 (July 7) *An Act to amend the Farm Credit Act* increases the capital of the Corporation to \$66 million; provides that the Corporation may make loans to facilitate the efficient operation of farms to be mortgaged; and extends the basis for determining the appraised value of farm lands to include the productive value of a secondary non-farm enterprise carried on on those lands. The Act limits the individuals, corporations and co-operative farm associations to which the Corporation may make loans to those individuals and those organizations whose shareholders or members are Canadian citizens or landed immigrants; limits to \$100,000 the loan to any farmer alone or jointly with others in a single farming enterprise; and reduces the age at which individuals may be eligible to obtain loans. It also provides for loans with respect to a farming enterprise that forms part of an economic unit, and provides for certain other amendments.

Chapter 20 (July 7) *An Act to amend the Pension Act* permits an increase in the number of Pension Commissioners to 14; and an increase in the number of ad hoc commissioners to ten, each ad hoc commissioner to be appointed for a period not exceeding one year.

Chapter 21 (July 7) *An Act to amend the Representation Commissioner Act* increases the salary of the Commissioner to equal that of a judge of the Federal Court of Canada.

Chapter 22 (July 7) *The St. Lawrence Ports Operations Act* provides for the immediate resumption of the operation of the ports of Montreal, Trois-Rivières and Quebec. The Act prohibits both strikes and lockouts during the term of the collective agreements to which this Act applies, and provides for arbitration of any matters in dispute.

Chapter 23 (September 1) *The West Coast Ports Operations Act* provides for the immediate resumption and continuation of longshoring and grain handling operations and operations relating to longshoring or grain handling at ports on the west coast of Canada. The Act prohibits strikes and lockouts during the term of the collective agreements to which this Act applies and provides for immediate commencement of negotiations to settle any matters in dispute.

Appendix 3

Canadian chronology, 1972

Events in the general chronology from 1497 to 1866 are given in the *1951 Canada Year Book*, pp. 46-49; from 1867 to 1953 in the *1954 Canada Year Book*, pp. 1259-1264; and annually from that year in successive editions. The following listing covers the year 1972; it should be noted that certain of the dates given are approximate. Acknowledgement is given to the publication *Canadian News Facts*, Toronto, for valuable assistance in the preparation of this chronology.

January

Jan. 1, Capital gains tax came into effect under revised income tax legislation passed December 23, 1971. *Jan. 2*, Federal government announced December 22, 1971 as valuation day for calculating future taxable gains on publicly traded stock market shares and December 31, 1971 for other assets to be subject to income tax for the first time under amendments to the Income Tax Act assented to December 23, 1971. *Jan. 5*, Ontario Cabinet reorganized, reducing the number of ministries from 24 to 20 and creating three new policy ministries, expanding the role of the provincial treasurer and establishing a fifth special ministry; ministers heading these five ministries, with the premier as chairman, comprise the Cabinet's Policy and Priorities Committee. *Jan. 6*, Death in Oshawa, Ont., at 100 years of age, of Col. R.W. McLaughlin, founder of the automobile manufacturing plant that was the forerunner of General Motors of Canada Ltd. *Jan. 7*, Geza Matri, a Hungarian immigrant, sentenced to three months in jail and put on two years probation for assaulting Soviet Premier Alexei Kosygin in Ottawa October 18, 1971. *Jan. 9*, Explosion of a nuclear bomb by China. *Jan. 17-29*, Strike of air traffic controllers grounded most commercial flights in Canada; salaries and hours of work were the issues and binding settlement by arbitration was agreed upon; arbitration award of 17.4% increase in salary over 27 months announced March 10. *Jan. 18*, Second report of the Senate Special Committee on Science Policy released; recommendations included formation of a new Crown corporation, Canadian Industrial Laboratories Corporation, to absorb the facilities of the National Research Council and other government departments, adoption of an over-all plan for science and technology, increased spending on research and development, and reappraisal of government-backed scholarship and fellowship schemes to fit industrial needs. Federal government banned seal hunting in the Gulf of St. Lawrence in 1972 by large fleet-sized vessels as well as aircraft; boat operators to be reimbursed for expenditures made for equipment during the season. *Jan. 19*, Minutes and associated documents of the Canadian Cabinet War Committee constituted December 5, 1939 released to the public at the Public Archives; highlights include Canadian refusal of US proposal to assume supreme command of Canadian Forces, Canadian concern over possible violent demonstrations by white Canadians against Japanese Canadians and Prime

Minister W.L. Mackenzie King's stand against conscription. *Jan. 22*, Treaty of Accession signed in Brussels by Prime Minister Heath admitted Britain as a member of the European Economic Community, effective January 1, 1973. *Jan. 24*, Pierre Vallières, *Front de Libération du Québec* leader wanted for seditious conspiracy and counselling to kidnapping and murder, surrendered to police. *Jan. 25*, Injunction restraining a woman from having an abortion issued in Ottawa on behalf of her husband and the "infant plaintiff", the unborn child, said to be the first such action in Canada and perhaps the first in North America. *Jan. 26*, Part One of final report of the LeDain Commission on the non-medical use of drugs released; recommendations included legalization of heroin for drug-addiction treatment in special circumstances (rejected March 29 by federal government as open to abuse) and an immediate search for a chemical to block the effects of amphetamine drugs. *Jan. 29*, Plans to establish on Vancouver Island in September 1973 the United World College of the Pacific, to be patterned after the United World College of the Atlantic established in 1962 at St. Donat's Castle in South Wales and to be a Canadian - US venture, announced jointly by Lester B. Pearson, honorary chairman of the College's Canadian national committee, and Robert L. Houston, committee chairman; head of the governing body to be J.V. Clyne of Vancouver. *Jan. 30*, Pakistan withdrew from the British Commonwealth over moves by other Commonwealth members, including New Zealand and Canada, to recognize Bangladesh, the former province of East Pakistan.

February

Feb. 1, Two-day conference of federal and provincial finance Ministers ended in Jasper, Alta.; discussions centred on the economic outlook for 1972 and the setting up of a contingency plan to deal with unemployment the following winter. *Feb. 1-Mar. 15*, Strike of Quebec hospital dietitians and therapists to protest lagging contract talks and the suspension of ten physiotherapists at a Montreal hospital; ended with acceptance of a temporary salary scale. *Feb. 2*, Canada's application for accreditation as a permanent observer to the Organization of American States approved unanimously by the Permanent Council of the OAS. *Feb. 3-13*, The 1972 Winter Olympic Games held at Sapporo, Japan; silver medal for figure skating won by Karen Magnussen of North Vancouver, BC. *Feb. 5-Mar. 4*, Quebec peace

officers, comprising prison guards, game wardens and others, on strike to back demands for wage parity with federal peace officers, forcing 22 of the province's 35 provincial prisons to close and disrupting the courts. *Feb. 6-Mar. 2*, Airport radar and communications technicians on strike at airports across Canada, tying up commercial air traffic; a new contract agreement gave pay increases of up to 15.1%. *Feb. 7*, Employees of Montreal's daily newspaper *La Presse* returned to work after settlement of a contract dispute that began October 27, 1971. *Feb. 8*, The Canadian Transport Commission rejected applications of the CNR and CPR to discontinue passenger service between Montreal and the Maritime Provinces; federal subsidies to be allowed by the Commission up to 80% of annual losses on uneconomic lines. *Feb. 9*, Formation of the Canadian Telecommunications Carriers Association, representing Canadian telephone companies, railway telecommunications operations, Canadian Overseas Telecommunication Corporation and Telesat Canada. *Feb. 11*, Federal government announced a \$1.7 million program of aid to Canadian book publishing industry, expected to double production of Canadian books, excluding textbooks, within five years; first grants awarded by Canada Council in November for purchase, translation and publication of Canadian books. *Feb. 14*, Canada officially recognized independence of Bangladesh, formerly East Pakistan. *Feb. 16-20*, The 14th meeting of the Canada-US Interparliamentary Group held in Ottawa to discuss foreign ownership policy and the effect on trade of Britain's joining the European Economic Community. *Feb. 21*, Canada formally agreed to accept international verification of the peaceful nature of its nuclear development program, permitting inspection by the International Atomic Energy Agency to verify that nuclear energy has not been diverted from peaceful to military uses. *Feb. 24*, Announcement by Panarctic Oils Ltd. of discovery of crude oil on Ellesmere Island, the first oil strike in the Arctic Islands. *Feb. 25*, Official opening of the \$750 million nuclear power plant of Ontario Hydro at Pickering, the largest single producer of power in the world. *Feb. 28*, Mme Pauline Vanier, widow of former Governor General Georges P. Vanier, left Canada to join her son Jean in work at L'Arche, a community for the mentally retarded near Paris, France.

March

Mar. 2, Plans for new international airport for Metropolitan Toronto, located about 30 miles northeast of the city in Pickering Township, announced by the federal and provincial governments. *Mar. 6*, Governor General Roland Michener presented the Yukon Territory Legislative Council with its first Mace, symbol of the authority of the Speaker of the Legislature. *Mar. 6*, Yves and Carmen Geoffroy, objects of an international search by police following the former's failure to return to St. Vincent de Paul Penitentiary on expiration of his three-day pass, arrested in

Barcelona, Spain, and returned to Montreal March 13. *Mar. 6-11*, Arctic Winter Games held in Whitehorse, YT, with more than 1,000 participants; Yukon Territory came first in points, but Alaska won the greatest share of the medals. *Mar. 7*, Five sq miles on Mount Logan presented to the Northwest Territories by Yukon Territory in compensation for a surveying error were immediately re-presented to Mrs. Michener, wife of the Governor General, for creation of the Norah Willis Michener game preserve. *Mar. 12*, Federal government announced agreement to give control of family allowances to Quebec, subject to certain limits and conditions. *Mar. 15*, Montreal poet Gaston Miron awarded the \$2,000 Canada - Belgium Literary Prize, co-sponsored by the Canadian and Belgian governments and awarded to French-language writers from the two countries. *Mar. 16*, Report of joint Senate-Commons Committee on the Constitution released; recommendations included recognition of the right to self-determination in any part of Canada by democratic means, no change in the monarchical system, restriction of the Senate's veto power over legislation and expansion of its investigatory role, and creation of an autonomous national capital area. *Mar. 22*, Winners of the Governor General's literary awards for 1971 announced by the Canada Council: Pierre Berton (non-fiction in English); Gérard Fortin (non-fiction in French); Mordecai Richler (fiction in English); Gérard Bessette (fiction in French); John Glassco (poetry in English); and Paul-Marie Lapointe (poetry in French). *Mar. 23*, Death of Senator Harry A. Willis of Toronto. *Mar. 24*, General Election held in Newfoundland; results of earlier election held October 28, 1971 were inconclusive; Progressive Conservative party led by Frank Moores defeated Liberal government of Joseph R. Smallwood after 23 years in office; party standings, 33 Progressive Conservative, 9 Liberal. *Mar. 27*, Agreements signed between Canada and France, Britain, Portugal and Denmark for gradual phasing out of their traditional and treaty fishing rights in Canadian waters off the east coast. *Mar. 30*, A naval tradition dating back to 1667 ended for the Canadian navy with the final issue of the daily rum ration.

April

Apr. 3, Announcement of the \$50,000 Royal Bank Award to Dr. Gustave Gingras of the Rehabilitation Institute of Montreal for his work with crippled children and adults. *Apr. 6*, Bomb explosion at the Cuban Trade Commission in Montreal caused extensive damage and killed one person; federal government apologized to the Cuban Ambassador for intrusion of Montreal police on diplomatic property and offered to pay for damages caused by the explosion. A large peninsula on Victoria Island in the Arctic Islands of the Northwest Territories named the Diamond Jenness Peninsula in memory of the distinguished Canadian anthropologist. *Apr. 8*, Death in Seoul, South Korea, while serving with the United Nations Development Program, of

former Saskatchewan Premier Woodrow S. Lloyd, who introduced Canada's first universal medical care insurance program. *Apr. 11*, Paul Joseph Cini of Calgary sentenced to life imprisonment for hijacking an Air Canada jetliner November 12, 1971. *Apr. 11-24*, In the largest strike in Canadian history, about 200,000 Quebec provincial employees, including Hydro-Quebec workers, teachers and hospital workers, left their jobs in support of salary and job security demands; strike ended by emergency legislation and the government instituted court action against unions and persons who ignored injunctions ordering maintenance of essential services; three top strike leaders given one-year jail sentences May 8, and appeals against the sentences were rejected November 13 by Quebec Court of Appeal. *Apr. 12*, Collection of 1,200 illustrations by Canadian artist the late C.W. Jeffreys presented to the Public Archives by Imperial Oil Limited. *Apr. 13-14*, Official visit to Canada of US President Richard M. Nixon and Mrs. Nixon; the President addressed a joint session of Parliament, talks were held with Canadian officials on mutual and international questions, and the Canada - United States Great Lakes Water Quality Agreement was signed. *Apr. 18*, The second annual Michener Award for Journalism for outstanding public service by news organizations in print and broadcasting won by the CBC documentary film *The Tenth Decade*, covering the 1957-68 governments of former Prime Ministers John G. Diefenbaker and Lester B. Pearson. Bangladesh, formerly East Pakistan, admitted to the British Commonwealth. *Apr. 19*, Stricter regulation of boxing matches announced, particularly with regard to contestants' health, following death in Winnipeg February 22 of Stewart Gray, light-heavyweight boxer of Toronto, from injuries suffered in a bout against Canadian champion Al Sparks of Winnipeg. *Apr. 21*, *Apollo XVI* astronauts set up astronomical observatory on moon, the first on another planet. Six-month "sit-in" by Cold Lake, Alta., Indians ended in agreement by federal government to provide \$750,000 for school facilities. *Apr. 24*, Federal government announced a ban on commercial salmon fishing in New Brunswick and the Port aux Basques area of Newfoundland to conserve stocks, effective May 1; more than 900 fishermen to be compensated, amounting to about \$2 million in the current fiscal year. *Apr. 26*, Death in Montreal of Elmer Ferguson, 87, former sportswriter and originator of the Hot Stove League for National Hockey League radio broadcasts. *Apr. 28*, Federal government announced commencement of construction of an all-weather highway to run 1,050 miles from the Alberta - Northwest Territories border to Tuktoyaktuk, NWT. *Apr. 28-July 22*, Union members of 18 building trades in British Columbia locked out by contractors, closing down \$500 million worth of construction as a result of escalated strike action by the plumbers' union; increased wage rates demanded by union negotiators granted by new contract. *Apr. 29*, Presentation of 600 books from the State Central Library in

Bucharest, Romania, to the National Library in Ottawa, one of a series of exchanges celebrating International Book Year; a gift of Canadian publications to be given to the people of Romania in September.

May

May 1, The Supreme Court of Canada ruled that a compulsory breath test for impaired drivers does not constitute a breach of the Canadian Bill of Rights clause concerning self-incrimination. CBC President George Davidson appointed Under-Secretary-General in charge of administration and management and a senior adviser to Secretary-General Kurt Waldheim of the United Nations, effective August 1. *May 2*, Federal government report on foreign investment in Canada released; primary proposal to oversee takeovers of moderate-sized and major Canadian industries by foreigners, such takeovers to be judged on the basis of "significant benefit to Canada". *May 5*, The Quebec Indian Association announced the filing of legal action in Montreal Superior Court to halt the province's proposed James Bay power project, claiming compensation under a 1912 pact in which Canada transferred northern Quebec to the province in return for which the province agreed to protect the interests of the Indians if the area were developed. *May 10*, Canada became the 24th member of the Inter-American Development Bank. *May 11*, Trial in Montreal of Jacques Rose for the October 1970 kidnapping of the late Quebec Minister of Labour Pierre Laporte ended with the jury unable to reach a unanimous verdict. The Stanley Cup won by Boston Bruins over New York Rangers four games to two in National Hockey League playoff competition. *May 17*, Part Two of the LeDain Commission report on the non-medical use of drugs released; recommended that penalties be abolished for simple possession of marijuana and hashish but that these drugs should not be legalized; and that importing and exporting of cannabis be included in the legal definition of trafficking. *May 18*, Death of Frank Hall, 78, Canadian labour leader. *May 22*, Ceylon became an independent social republic, remaining within the Commonwealth, and renamed Sri Lanka. *May 23*, Robert Lemieux, defence lawyer for Jacques Rose, sentenced for contempt of court for refusing to divulge the names of jurors who told him the jury's vote in the trial. *May 24*, Canada's first Olympic Torch Awards presented at the National Arts Centre in Ottawa; Percy Williams of Vancouver, winner of two gold medals at the 1928 Olympics, named outstanding performer; other winners were Barbara Ann Scott King (figure skating), Nancy Greene Raine (skiing), Barbara Wagner Grogan and Bob Paul (pairs figure skating), and team of Jim Day, Jim Elder and Tom Gayford (equestrian performance). *May 24-25*, Official visit to Canada of Secretary-General Kurt Waldheim of the United Nations. *May 28*, Death in Paris of the Duke of Windsor, aged 77. *May 29*, The Quebec govern-

ment banned all commercial salmon fishing off the tip of the Gaspé peninsula, effective June 1, because of declining yield. *May 31*, Prime Minister Trudeau announced establishment of new Canadian awards for bravery and merit for civilians and the Armed Forces, and the addition of a new level to the Order of Canada for contribution to individual communities, professions or other groups.

June

Canadian Council on International Law established to provide a forum for Canadian academics active in public international law and organization and to facilitate closer contact between the academic community and government officials in the field as well as to broaden relations between Canadian international lawyers and interested individuals outside Canada; first meeting held in mid-October in Ottawa. *June 5-6*, UN Conference on the Human Environment, under leadership of Maurice Strong, held in Stockholm; an environmental protection code, to be co-ordinated by a new UN agency, was adopted. *June 8*, Rt. Hon. Lester B. Pearson invested with the Order of Merit by Queen Elizabeth in a ceremony at Buckingham Palace. *June 11*, The 100th anniversary of the birth of Col. John McCrae, composer of the poem *In Flanders Fields* during World War I, celebrated in Guelph, Ont.; tributes received from Queen Elizabeth and Pope Paul. *June 13*, Rt. Hon. Lester B. Pearson awarded the Victor Gollancz humanity award in London, Eng., in recognition of work in the humanitarian field, especially in relation to developing countries. *June 13-Sept. 13*, Strike of steelworkers at Iron Ore Co. of Canada plants at Schefferville, Que. and Labrador City, Nfld.; ended in appointment of commission to investigate the dispute. *June 16*, Official inauguration ceremony of the largest single-site hydro-electric power development in the western world at Churchill Falls, Labrador; attended by Prime Minister Trudeau, Premier Frank Moores of Newfoundland and Premier Robert Bourassa of Quebec. *June 18*, The 113th running of the Queen's Plate at Woodbine, Toronto, won by Victoria Song, owned by Mrs. William Seitz of Toronto. *June 19*, The 2,000-member Canadian Airline Pilots Association joined the International Federation of Airline Pilots Association in a 24-hour strike in protest over hijackings and in support of more stringent international laws. *June 23*, Five-month strike of 2,200 broadcast technicians against the CBC ended with new contract providing for salary increases and guarantees as to job security. *June 29*, A major exhibition of Canadian Eskimo art, presented under the auspices of the Canadian government, opened in the Hermitage Museum in Leningrad, USSR, the largest showing of Canadian sculpture ever shown abroad and the first shown in that country. The Supreme Court of Canada ruled that motorists have the right to consult their lawyers before agreeing to take breath tests to determine the amount of alcohol they have consumed.

July

July 5, Fines totalling \$12,500 levied against the International Longshoremen's Association, its president and three of its business agents for contempt of court in violating provisional injunctions ordering dockers back to work in the Port of Montreal in May. The National Ballet of Canada ended its first European tour after highly acclaimed performances in Monte Carlo, London, Glasgow, Paris, Stuttgart and Lausanne. *July 6*, Agreement announced between Canada and the USSR for broad program of cultural and scientific exchanges, including extended co-operation in Arctic development. *July 7*, Special legislation passed in Parliament ending the seven-week strike of longshoremen in ports on the St. Lawrence River. *July 10*, Fourteen prisoners at the federal maximum security penitentiary at Millhaven, Ont., escaped; the last of the 14 was arrested in Yugoslavia November 17. A total eclipse of the sun was visible in a belt about 100 miles in width across southeastern Canada. *July 12*, Federal government rejected a commercial proposal to establish a \$30 million Village Lake Louise complex in Banff National Park. *July 14*, Donald MacDonald, president of the Canadian Labour Congress, elected the first non-European president of the International Confederation of Free Trade Unions, an association of trade unions in 91 western countries. *July 16*, Death in Bathurst, NB, of Charlie Chamberlain, 61, veteran television, radio and stage performer. *July 17*, Federal government announced the New Horizons program for retired people, to provide money to groups who design their own programs to ease loneliness and isolation but not to provide employment; first grants, totalling \$578,000, announced December 19. Dedication of new St. Boniface, Man., cathedral, built within the walls of the historic structure founded in 1818 and destroyed by fire July 22, 1968. *July 20*, Ronald W. McCracken, Keswick, Ont., awarded the American Library Association Grolier Award for his work in developing libraries in his area, the first Canadian to be so honoured. Federal government increased minimum wages for employees under its jurisdiction from \$1.75 per hour to \$1.90 for employees 17 years and over, and from \$1.50 to \$1.65 for those under 17, effective November 1. *July 24*, Federal government announced plans for a Canada-wide inventory of sources and quantity and nature of emissions of four air pollutants — lead, beryllium, mercury and asbestos — that pose a potential hazard to health. *July 27*, First pictures of Canada received from the US-owned earth resources technology satellite exceeded the expectations of both NASA and the Canada Centre for Remote Sensing; high-altitude photographs will cover every portion of Canada four times a year and provide valuable information about resources, forests, crops, ice and geological formations. *July 28*, A special book containing all first-day-of-issue special covers for Canadian stamps, embossed in gold and showing the Great Seal of Canada and the Mace, together with the

words "House of Commons" and "First Day of Issue" in both languages — the only such collection in the world — to be displayed in the Library of Parliament. *July 31*, Death in Brussels of Paul-Henri Spaak, 73, former Belgian premier and foreign minister, first president of the UN General Assembly and one of the founders of the European Economic Community. Elimination of jail terms for first-time convictions for marijuana possession announced by the federal government.

August

Aug. 2, The Arctic Waters Pollution Prevention Act (RSC 1970, c.2, 1st Supp.) proclaimed; established absolute liability of ship owners and cargo owners for pollution of Arctic waters. *Aug. 3-4*, The 13th annual conference of provincial premiers held in Halifax; topics of discussion included off-shore mineral rights, federal-provincial-municipal relations, and winter employment. *Aug. 6*, Death in Trois-Rivières of Senator Léon Méthot, 77. *Aug. 8*, Following public protest against the appointment of an American as chief of police in Calgary, Charles R. Gain withdrew "because of the intense nationalistic feelings he has experienced". *Aug. 14*, The government of Prince Edward Island named a Royal Commission to investigate land use in the province and the sale of land to non-islanders. *Aug. 15*, Harold Ballard, president of Maple Leaf Gardens, Toronto, convicted of 47 fraud and theft charges involving almost \$205,000 in Gardens funds; sentenced October 20 to three years in penitentiary. *Aug. 17*, Report of the Dennis study on housing, established in 1971 through the Central Mortgage and Housing Corporation, revealed that the six leading developers in ten of Canada's largest cities own at least half and in most cases nearly all the residential land required for development in this decade in each city. Dr. Norman Bethune, internationally known for his medical work in Spain and China, declared by the federal government to be a Canadian of national historic significance; Ontario government unveiled a commemorative plaque at his birthplace in Gravenhurst, September 10. *Aug. 21*, Death in Montreal of A.M. Klein, 64, one of Canada's best-known poets. The Quebec Securities Commission announced new regulations for registering securities salesmen, effective September 1; probationary or temporary registration to be prohibited. Ontario government announced the introduction of five-year licence plates effective in 1973; for an extra \$25 such plates may be "personalized". Newfoundland government announced a special commission or secretariat to investigate files and records of former Premier Joseph R. Smallwood. *Aug. 21-30*, The 24th session of the International Geological Congress, the oldest scientific organization in existence, opened in Montreal, attracting 5,000 geologists from 107 countries. *Aug. 21-Sept. 2*, Canadian Trade Exposition held in Peking, China, the largest trade fair in Canada's history; visited by Premier Chou En-lai, his first visit to a foreign trade fair in China.

Aug. 22-Sept. 10, Exhibition of paintings by the late Emily Carr held at the Commonwealth Institute in London, Eng. *Aug. 24*, Edmonton selected as the site of the 1978 Commonwealth Games. Federal government agreed to admit, on an emergency basis if necessary, Asians holding British passports who were ordered to leave Uganda August 5; by November 8, 4,420 persons had been received as immigrants. *Aug. 30*, General Election held in British Columbia; Social Credit government under Premier W.A.C. Bennett, in power for 20 years, defeated by New Democratic Party led by David Barrett; party standings, 38 New Democratic Party, ten Social Credit, five Liberal and two Progressive Conservative. As a result of about 2,000 Canadians being stranded in Europe and a similar number of Europeans in Montreal with worthless ticket vouchers, the Canadian Transport Commission issued new regulations to ensure that charter trips will be completed. *Aug. 31*, Darcy McKeough resigned as Ontario provincial treasurer because of apparent conflict of interest.

September

Sept. 1, In a special session of Parliament, BC longshoremen, on strike since August 5, were ordered back to work to ensure shipment of record wheat sales to China, Japan and USSR. Thirty-seven persons died and 54 were injured in a fire set by arsonists in the Blue Bird Club in Montreal, the city's worst fire disaster since 1927; three men found criminally responsible October 6, two sentenced December 4 to life imprisonment on conviction for non-capital murder and the third remanded. *Sept. 1-28*, In hockey tournament between Canada and USSR, agreed to April 18, four games played in Montreal, Toronto, Winnipeg and Vancouver; final four games in USSR. Team Canada winning series in final game in Moscow. *Sept. 4*, Theft of paintings and art objects valued at \$2 million from Montreal Museum of Fine Arts, including a Rembrandt valued at \$1 million. *Sept. 5*, Modifications to the Immigration Act allow aliens who had entered Canada as visitors to apply for landed immigrant status; suspended November 3. Announcement of development by a National Research Council engineer and two Queen's University anatomists of a process using electromagnetic radiation to reduce the healing time of open wounds by as much as 100 times. *Sept. 11*, The 20th Olympic Games closed in Munich, Federal Republic of Germany; Canadians won two silver and three bronze medals; event marred September 5 by the killing of 11 Israeli athletes by Arab terrorists. *Sept. 12*, Heritage Canada, an independent national trust, established by the federal government to hold and preserve buildings, natural areas and scenic landscapes for future Canadians. *Sept. 14*, Premier Davis of Ontario announced a series of guidelines to be followed by Cabinet Ministers with regard to possible conflict of interest. *Sept. 15*, Eight-month strike of workers at the DeHavilland Aircraft Co. of Canada Ltd. plant in Toronto ended in a new contract for an average pay

increase of \$1.05 per hour at the end of three years.

Sept. 17, Official opening of Cartier-Brébeuf National Historic Park in Quebec City; established to honour Jacques Cartier, explorer, and Jean de Brébeuf, missionary. *Sept. 20*, Discovery of letter bombs addressed to the Israeli embassy in Ottawa and to the Israeli consulate in Montreal. *Sept. 21-Oct. 23*, Strike of steelworkers at Sydney, NS; ended with grant increasing the basic rate of pay by 33.5%. *Sept. 27*, Federal government announced a ban on the sale of firecrackers to the general public.

October

Oct. 3, The 90th birthday of A.Y. Jackson, only surviving member of the original Group of Seven artists, celebrated by displays and exhibitions of his works. *Oct. 3-10*, Indications reported of gas and oil in the Grand Banks off Newfoundland, off-shore Sable Island near Nova Scotia and on Melville Island in the Arctic. *Oct. 4*, Pierre Vallières, author and a founder of the separatist FLQ, given a one-year suspended sentence on three charges of counselling political kidnappings and ordered to keep the peace, appear before the court upon demand and to meet other conditions. *Oct. 12*, The International Joint Commission reported that more than 90% of the pollution in the Windsor, Ont., district comes from the US, doubling the safety level of concentration of sulphur dioxide and solid particulates in the core area and reducing the quality of Canadian air to well below standards set by Ontario. Nation-wide drug raids by the RCMP and local police, following a six-month investigation by the RCMP, resulted in arrest of more than 100 persons suspected of drug trafficking in Vancouver, Victoria, Toronto, Moncton and Hull. *Oct. 13*, Civil air agreement concluded between Canada and China; direct flights expected to begin early in 1973. A plaque in honour of Poundmaker, plains Cree chief and spokesman for Indian treaty rights during the Second Riel Rebellion, unveiled by his great grandson, Jimmy Poundmaker, on the Poundmaker Indian Reserve near Cut Knife, Sask. *Oct. 20*, The Canadian Transport Commission announced that effective April 1, 1973 transatlantic air charters will be open to anyone who books his seat in advance, provided a deposit is paid, superseding existing "affinity" regulations under which charters could be organized only by clubs or organizations formed for a purpose other than travel and of which travellers must have been members for at least six months. The 12,000 union employees of Ontario Hydro ended 122-day strike with agreement to submit unresolved contract issues to arbitration. *Oct. 27*, The BC Legislature passed legislation guaranteeing \$200 monthly to handicapped and persons over age 65. *Oct. 30*, General Election held in Canada; in the closest vote in Canadian history, party standings were 108 Liberal, 109 Progressive Conservative, 30 New Democratic Party, 15 Social Credit and two Independent, later revised to 109 Liberal, 107 Progressive Conservative, 31 New Democratic Party, 15 Social Credit, one Independent and one no party affiliation.

November

Nov. 3, The Canada Development Corporation announced acceptance of its application for membership in the Canadian Arctic Gas Study Group, composed of 17 Canadian and US companies whose principal concern is completing studies preparatory to the construction of a natural gas pipeline along the Mackenzie River valley. *Nov. 4*, George Harold Campbell, 94, Canada's oldest Olympic gold medallist, died in Orangeville, Ont. *Nov. 6*, Louis Rasminsky announced his resignation as Governor of the Bank of Canada, effective February 1, 1973. *Nov. 7*, Richard Milhaus Nixon re-elected President of the United States. *Nov. 9*, Anik-1, Canada's first domestic communications satellite, to be operated by Telesat Canada, launched at Cape Kennedy, Florida; it will provide for a more reliable telephone service and an expanded radio service in French and English, and bring live television in both languages and in colour to communities in Labrador and north of the Arctic Circle. *Nov. 14*, Official approval announced for construction of the Strategic Automatic Message Switching Operational Network (SAMSON), a computer-controlled message-handling network connecting Canadian Armed Forces bases and posts in Canada and Europe. *Nov. 15*, The Quebec government passed emergency legislation ordering 8,500 striking workers of Hydro-Quebec to maintain essential services. Alberta government passed its own Bill of Rights aimed at "protecting the citizen from the power of the state". *Nov. 16*, Unity Bank of Canada (L'Unité, Banque du Canada) licensed as Canada's tenth chartered bank under federal legislation assented to March 29; head office, Metropolitan Toronto. *Nov. 18*, Death in Montreal of former Senate Speaker Thomas Vien, aged 91. Death in Montreal of Very Rev. James Sutherland Thomson, 80, former Moderator of The United Church of Canada and former dean of divinity at McGill University. *Nov. 20-21*, The first federal-provincial-municipal government conference held in Toronto; agreement that further meetings should be held on a regional level to deal with urban problems in a specific province or group of provinces. *Nov. 22*, Premier Davis of Ontario outlined proposals for re-shaping the mass transit systems of Toronto, Hamilton and Ottawa, using electrically operated trains on elevated tracks. *Nov. 23*, Legislation introduced in the Ontario Legislature to give individuals the right under law to know what information credit agencies have about them and to correct any inaccuracies. *Nov. 24*, Bill introduced in the Quebec National Assembly to provide 13 new electoral enclaves in northern Quebec to enable approximately 1,500 Eskimos, 3,500 Indians and several hundred white persons to vote. George Davidson, former president of the CBC, awarded the Vanier Medal, presented annually by the Institute of Public Administration of Canada for exceptional achievement in public affairs. The Outstanding Achievement Award of the Public Service of Canada for 1972 awarded to R. Gordon Robertson, Clerk of the Privy Council and Secretary to the Cabinet. *Nov. 25*, An armed

man who held an Air Canada hostess hostage for 24 hours in Frankfurt, Federal Republic of Germany, killed by police. *Nov. 29*, Federal government approved a three-phase, \$74 million project to broaden, computerize and eventually automate air traffic surveillance to improve safety and efficiency of air traffic control in southern Canada and help cope with air traffic congestion around large cities. *Nov. 30*, Dr. W.B. Lewis, vice-president of Atomic Energy of Canada Ltd., awarded a "royal medal" by the Royal Society in London for his contributions to the development of heavy water reactors for power generation. Agreement signed by provincial and regional egg producing and marketing authorities to set up the National Farm Products Marketing Council.

December

Dec. 1, Unemployment insurance contribution rate increased for Canadian workers and employers. *Dec. 3*, Death in Toronto of Alan Jarvis, former director of the National Art Gallery. The Hamilton Tiger-Cats won the Grey Cup by defeating the Saskatchewan Roughriders by a score of 13-10 in Canadian professional football playoffs. *Dec. 4*, The federal government announced the provision of \$350 million to the provinces and municipalities for job-producing programs over the next three years; and an additional \$150 million for federal programs. *Dec. 9*, Jacques Rose acquitted in Montreal in second trial for kidnapping the late Quebec Minister of Labour Pierre Laporte. Bush pilot Martin Hartwell, lost on a mercy flight, found alive in Northwest Territories 32 days after crash of his aircraft in which his three passengers died. *Dec. 11*, Apollo astronauts walked on moon in last lunar expedition scheduled for this decade; successful splashdown in Pacific December 19. *Dec. 12-14*, First annual consultative meeting held in Ottawa under the Agreement between Canada and the Federal Republic of Germany on Scientific and Technical Co-operation of April 16, 1971. *Dec. 15*, Federal government recommended a delay in construction of the Mackenzie Highway announced April 28 in order to review possible effects on the ecology. *Dec. 19*, The National Gallery of Canada purchased a 16th century French painting *The Surrender of Milan* by Antoine Caron of the Fontainebleau School. *Dec. 20*, Federal government announced an immediate ban on whaling off the east coast by Canadian ships because of declining stocks. *Dec. 26*, Death in Kansas City, Mo., of Harry S. Truman, 88, former President of the United States. *Dec. 27*, Death in Ottawa of Rt. Hon. Lester B. Pearson, 75, former Prime Minister of Canada.

Appendix 4

Canadian honours

An exclusively Canadian honours system was introduced in 1967 with the establishment of the Order of Canada. The honours system was enlarged in 1972 with the addition of the Order of Military Merit and three decorations to be awarded in recognition of acts of bravery.

The Order of Canada, instituted on July 1, 1967, the 100th anniversary of Confederation, is designed to honour Canadians for outstanding achievement and service to their country or to humanity at large. Originally, two levels of membership were provided: Companions of the Order and recipients of the Medal of Service. The Order was revised in 1972 and now comprises three categories of membership: Companions, Officers – which includes all those who received the Medal of Service – and Members. The latter category is intended especially to recognize service in a locality or in a particular field of activity. Not more than 15 persons may be appointed in any one year as Companions and the total number of Companions is not to exceed 150. Officers of the Order may be appointed to the number of 40 persons a year and up to 80 persons may be appointed yearly as Members of the Order.

All Members of the Order are entitled to have letters placed after their names, as follows: for the Companion CC, for the Officer OC and for the Member CM.

Her Majesty The Queen is Sovereign of the Order and the Governor General holds office as Chancellor and Principal Companion. Appointments to the Order are made, with the approval of the Sovereign, by the Governor General with the assistance of an Advisory Council which meets twice each year under the chairmanship of the Chief Justice of Canada. Members of the Advisory Council include the Clerk of the Privy Council, the Under-Secretary of State, the Chairman of the Canada Council, the President of the Royal Society of Canada, the President of the Association of Universities and Colleges of Canada and not more than two other members who may be appointed by the Governor General from among the present members of the Order.

While Canadians are the primary recipients of the Order, the constitution provides that persons who are not Canadian citizens and whom Canada desires to honour may be appointed as honorary members at any of the three levels of membership.

The Order of Military Merit has been established to provide a means of recognizing conspicuous merit and exceptional service by members of the Canadian Armed Forces, both Regular and Reserves. The Order has three levels of membership: Commander (CMM), Officer (OMM) and Member (MMM).

The Queen is the Sovereign of the Order and the Governor General is the Chancellor as well as being a Commander of the Order. The Chief of the Defence Staff is the Principal Commander of the Order. Appointments to the Order are made by the Governor General on the recommendation of the Minister of National Defence; nominations are made by the Chief of the Defence Staff who is assisted by an advisory committee for the Order.

The number of appointments made annually will vary, depending on the number of nominations submitted and approved. The Order's constitution stipulates, however, that the total number of appointments made annually will not exceed one tenth of one percent of the average strength of the Forces. Members of foreign armed forces who render particularly meritorious service to Canada or the Canadian Armed Forces in the course of their military duties may be made honorary members of the Order at any of the three levels.

Canadian bravery decorations. A Medal of Courage was included in the Order of Canada in 1967 but it was found that a single medal would not serve to recognize in an equitable manner acts of bravery which entail varying degrees of risk. Consequently, no awards were made and the medal has now been superseded by a series of three decorations: the Cross of Valour (CV), the Star of Courage (SC) and the Medal of Bravery (MB). Instances of extraordinary heroism in circumstances of extreme peril will be marked with the award of the Cross of Valour; other outstandingly courageous actions may qualify for the award of the Star of Courage or the Medal of Bravery. The bravery decorations are awarded with the approval of the Sovereign by the Governor General on the advice of the Canadian Decorations Advisory Committee. They may be awarded to civilians, members of the Canadian Armed Forces and of the protective services and may be awarded posthumously.

Order of Canada

Companions **Appointed June 23, 1972**

Dr. Mario Bernardi, CC, D.Mus.

Mlle Marie-Claire Blais, CC

Dr. Balfour W. Currie, CC, FRSC, M.Sc., Ph.D.

Dr. Northrop Frye, CC, MA, DD, LL.D., D.Litt.,
FRSC

Mr. John C. Parkin, CC, FRSA, FRIBA, FRAIC,
RCA, FSIAD

M. Adrien Pouliot, CC, D.Sc., L.ès.Sc., D.Ph., MA,
LL.D., D.ès.L.

The Hon. John P. Robarts, PC, CC, QC, LL.D.,
DCL

Order of Canada (continued)

The following Officers are elevated to Companions:

Révêrend père Clément Cormier, CC, csc, D.Th.
M. le docteur Gustave Gingras, CC, MD, FRSA, LL.D., FRCP(C)
Dr. Chester A. Ronning, CC, MA, B.Sc., LL.D.

Officers Appointed June 23, 1972

Mlle Madeleine Bergeron, OC, BA, B.Sc.Soc.
Mrs. Lily E. Butters, OC
Dr. Thomas W. M. Cameron, OC, MA, Ph.D., D.Sc., FRSC
M. François E. Cleyn, OC, D.Ph.
Lieutenant Robert Côté, OC
Dr. Peter M. Dwyer, OC, LL.D. (*deceased*)
Mr. Frank H. Ellis, OC
The Hon. George A. Frecker, OC, LL.D., D.Paed., FRCGS
Mr. Arthur E. Gelber, OC
M. Roland Giroux, OC
Mr. Foster W. Hewitt, OC
Dr. Herbert H. Jasper, OC, MDCM, M.Sc., Ph.D., FRSC, D.Sc.
Mrs. Gertrude Laing, OC, BA
M. Robert LaPalme, OC
Dr. Isabel MacArthur, OC, B.Sc., MA, D.Educ.
Mr. Maxwell W. Mackenzie, OC, CMG, B.Comm., C.A.
Reverend Father Edmund J. McCorkell, OC, csb, MA, LL.D.
Dr. Katharine McLennan, OC, LL.D.
Mr. Oscar E. Peterson, OC
Mr. Jack L. Shadbolt, OC
Dr. Chester Bryant Stewart, OC, MDCM, CD, B.Sc., FAPHA, DPH
Miss Teresa Stratas, OC
Sister Catherine Wallace, OC, sc, MA, Ph.D., DCL, LL.D.
Mr. Daniel A. Yanofsky, OC, B.Sc., LL.B., BCL
Dr. Ayala Zacks, OC, LL.D.

Companions Appointed December 22, 1972

L'hon. Fernand Choquette, CC, LL.L., CR
The Hon. John Valentine Clyne, CC, BA, K.St.J.
Dr. George F. Davidson, CC, MA, Ph.D., LL.D., LHD
Dr. Robertson Davies, CC, B.Litt., DCL, FRSC
Air Chief Marshal Frank R. Miller, CC, CBE, CD, B.Sc., LL.D.
M. Marcel Vincent, CC, M.Comm., D.Ph.

Officers Appointed December 22, 1972

Dr. John Milton Bell, OC, B.Sc.A., M.Sc., Ph.D., FAIC
Dr. Roloff Wilfrid Beny, OC, MA, LL.D.
The Hon. Douglas Lloyd Campbell, OC, LL.D.
Dr. Charles F. Comfort, OC, CD, LL.D., RCA
M. Camille A. Dagenais, OC, B.Sc.A.
Dr. Jean F. Davey, OC, OBE, BA, MD, FRCP(C), FACP
Mr. Phil Esposito, OC

Mgr Paul-Emile Gosselin, OC, p.d., D.Ph.
Dr. Harry B. Hawthorn, OC, M.Sc., Ph.D., FRSC
Dr. James A. Houston, OC, D.Litt., LL.D.
Dr. Richard D. Jones, OC, MA, BST, LL.D.
The Right Rev. Msgr. Dr. Basil Kushnir, OC, D.D.
Dr. John Francis Leddy, OC, MA, D.Phil., D.Litt., D.ès.L., LL.D., DCL, FR.Hist.S.
M. le docteur Jean-Jacques Lussier, OC, MD, M.Sc., D.Ph.
Mr. Albert Martin, OC, CD
Dr. Donald MacDonald, OC, LL.D.
Dr. Louis Boyd Neel, OC, CBE, MA, MRCS, LRCP, Hon. RAM
Dr. Arthur Charles Neish, OC
Miss Betty Oliphant, OC, FISTD (CSB, SB)
Mr. I. Norman Smith, OC
M. Alfred Tremblay, OC

Members Appointed December 22, 1972

Mr. William Adkins, CM
Dr. Elizabeth Bagshaw, CM, MD
Mlle Jocelyne Bourassa, CM, B.Sc.
Mr. Douglas Bremner, CM, B.Sc., P.Eng., MEIC
Révêrend père Gaston Carrière, CM, OMI, L.Ph., L.Th., D.Ph.
Mr. Sam Crow, CM
Mr. Nicholas R. de Grandmaison, CM, ARCA
Révêrend père Marcel de la Sablonnière, CM, s.j. BA
Professor Colin D. diCenzo, CM, CD, DIC, M.Sc. P.Eng.
Mr. George Michael Flood, CM
Soeur Alice Gervais, CM, MA
Dr. M. David Graham, CM, MDCM, BA, CD
Dr. Hilda Alice Hellaby, CM, L.Th., DD, D.Th.
Mr. William Donald Hurst, CM, B.Sc., MEIC
M. L'abbé Pierre Hurteau, CM, MSW, L.Péd.
Mrs. Jane L. Hutchings, CM, RN
Mrs. Mary Adelaide Jennings, CM
Dr. Herman Smith Johannsen, CM, LL.D.
Mr. James G. Kettles, CM
Mrs. Mabel E. Krug, CM
M. Jean-Louis Lagassé, CM, BA, LL.B.
M. le professeur Georges Maheux, CM, MA, M.Sc., L.Sc., D.Sc., D.Sc.For., SRC
Son Honneur M. Roger Malaisson, CM
M. Guy Mauffette, CM
Mme Nicole-Henriette Mongeau, CM
Reverend Father James J. Morelli, CM, BA
Mrs. Phyllis B. Munday, CM, RN
Dr. Bertram Reid MacKay, CM, B.Sc., Ph.D., FRSC, FGSA, FRCGS
Dr. C. Lamont MacMillan, CM, MDCM
Dr. Stanley H. McCuaig, CM, QC, LL.D.
Son Honneur M. Adrien Ouellette, CM
Major Elizabeth Peacocke, CM
Mr. Reynold Pehkonen, CM
M. Robert Prévost, CM
Mr. J. Howard Richardson, CM
Dr. Kathleen Rowan-Legg, CM, LL.D.
Mrs. Polly Sargent, CM
Colonel Frank J. Storey, CM, ED
M. Joseph Arthur A. Villeneuve, CM
Mr. Donald Wetmore, CM, MA

Order of Military Merit**Effective Dec. 13, 1972****Commander**

Rear-Admiral John Alexander Charles, CMM, CD
 Lieutenant-General Michael Reginald Dare, CMM, DSO, CD
 Major-General William Arnold Howard, CMM, CD
 Major-General Norman Lawrence Magnusson, CMM, DSC, CD
 Lieutenant-général Gilles Antoine Turcot, CMM, CD

Officer

Captain Lawrence Campbell Bowen, OMM
 Capitaine Joseph Jean Armand Marcel Brière, OMM, CD
 Lieutenant-Colonel Borden Ross Campbell, OMM, CD
 Lieutenant-Colonel Richard Gerald Arthur Clare, OMM, CD
 Lieutenant-Colonel Colin MacDonald Curleigh, OMM, CD
 Captain William Thomas Floyd, OMM, CD
 Colonel James Andrew Fulton, OMM, CD
 Captain Beatty Peever Hill, OMM, CD
 Captain Arlan Keith Hird, OMM, CD
 Major Donald Bateman Hope, OMM, CD
 Major Paul Frederick Hope, OMM, CD
 Capitaine Joseph Emile Landry, OMM
 Major Archibald Fraser Leith, OMM, CD
 Lieutenant-colonel Joseph Ernest John Albert Lévis, OMM, CD
 Major Owen Kenneth Ruthven MacLean, OMM, CD
 Captain Thomas Marshall, OMM, CD
 Major Thomas Stephen Martin, OMM, CD
 Captain Desmond Allan Price, OMM, CD
 Major Joseph Alfred Jean Spénard, OMM, CD
 Captain Edna Ruth Stokes, OMM, CD
 Colonel Gérard Charles Édouard Thériault, OMM, CD

Member

Master Warrant Officer Clifford Forbes Baker, MMM, CD
 Chief Warrant Officer John Hugh Barben, MMM, CD
 Adjutant Joseph Jacques Yvon Bélanger, MMM, CD
 Chief Warrant Officer Bernard William Bell, MMM, CD
 Soldat Raymond Lucien Bernier, MMM
 Sergeant Joseph Marcel Jean Pierre Blanchet, MMM
 Sergeant Kenneth George Bradley, MMM, CD
 Master Warrant Officer Rupert Denis Brown, MMM, CD
 Corporal Roland George Callacott, MMM, CD
 Corporal Douglas Cavener, MMM, CD
 Master Warrant Officer Howard Clark, MMM, CD
 Corporal Dave Arnold Claxton, MMM
 Sergeant Patrick Charles Condon, MMM

Adjutant-chef Achille Gérard Couillard, MMM, CD
 Sergeant Joseph Éloi Daigle, MMM, CD

Ruth McWilliams (now Mrs. T.J. Hewitt)	July 20, 1972
Paul Mraz (<i>posthumous</i>)	Oct. 19, 1972
Ronald Page	Oct. 19, 1972
Corporal Gordon William Rowe	Oct. 19, 1972
James G. Scarlett	July 20, 1972
Charles Simard	July 20, 1972
Lewis Owen Skidmore	Aug. 24, 1972
Major John A.S. Walker	Aug. 24, 1972
Siegfried Wolf (<i>German citizen</i>)	Oct. 19, 1972

Appendix 5

Books about Canada

This basic list of books about Canada, contributed by the National Library of Canada, includes a selection of publications grouped alphabetically by author and arranged under the subject classifications of The Arts and the Performing Arts, Biography, Country and People, Economics, Government and Politics, History, Literature, General Reference Works and Science. The brief list of science books was contributed by the National Science Library (NRC). Titles are listed in the language in which they are published. The selection emphasizes books which have been received during the past year establishing a new pattern for this and future editions of the *Canada Year Book* in contrast to the practice in previous years of providing a list covering a three- to five-year period. This list is limited to about 200 titles. For additional titles, the reader should consult the lists of books in earlier editions of the *Canada Year Book* or the monthly or annual editions of *Canadiana*, the national bibliography, published by the National Library.

The arts and the performing arts

Arthur, Eric and Dudley Witney. *The barn; a vanishing landmark in North America*. Toronto, McClelland and Stewart, 1972. 256 p.

Book Promotion and Editorial Club. *The look of books, 1972; twenty-eight books chosen as the outstanding examples of Canadian book design and production*. Toronto, 1972. 40 p.

Burnham, Harold B. and Dorothy K. Burnham. *Keep me warm one night: early handweaving in eastern Canada*. Toronto, University of Toronto Press in co-operation with the Royal Ontario Museum, 1972. 387 p.

Creative Canada; a biographical dictionary of twentieth century creative and performing artists. Toronto, published in association with McPherson Library, University of Victoria, by University of Toronto Press, 1971-1972. 2 vols.

Dow, Helen J. *The art of Alex Colville*. Toronto, McGraw-Hill Ryerson, 1972. 231 p.

Gundy, H. Pearson. *The spread of printing: Canada*. London, Routledge and Kegan Paul, 1972. Vol. 1 (Spread of printing series, 1).

Lessard, Michel et Huguette Marquis. *Encyclopédie de la maison québécoise, trois siècles d'habitations*. Montréal, Éditions de l'Homme, 1972. 727 p.

Lessard, Michel et Huguette Marquis. *Encyclopédie des antiquités du Québec, trois siècles de production artisanale*. Montréal, Éditions de l'Homme, 1971. 526 p.

Morris, Jerrold. *The nude in Canadian painting*. Toronto, New Press, 1972. 89 p.

New, William H. *Dramatists in Canada; selected essays*. Vancouver, University of British Columbia Press, 1972. 204 p.

Robert, Guy. *Borduas*. Montréal, Presses de l'Université du Québec, 1972. 340 p.

Such, Peter. *Soundprints; contemporary composers*. Toronto, Clarke, Irwin, 1972. 171 p.

Swinton, George. *Sculpture of the Eskimo*. Toronto, McClelland and Stewart, 1972. 255 p.

Trudel, Jean. *Un chef-d'oeuvre de l'art ancien du Québec: la chapelle des Ursulines*. Québec, Presses de l'Université Laval, 1972. 115 p.

Unitt, Doris J. and Peter Unitt. *Bottles in Canada*. Peterborough, Ont., Clock House, 1972. 240 p.

Withrow, William. *Contemporary Canadian painting*. Toronto, McClelland and Stewart, 1972. 223 p.

Biography

Anahareo. *Devil in deerskins, my life with Grey Owl*. Toronto, New Press, 1972. 190 p.

Bertrand, Lionel. *Mémoires de l'honorable Lionel Bertrand*. Montréal, Éditions du Jour, 1972. 290 p.

Casgrain, Thérèse-F. *Une femme chez les hommes*. Montréal, Éditions du Jour, 1971. 296 p.

Appendix 6

Government information services

Information Canada was established in April 1970 to act as a central source for the public seeking information on federal government policies, programs and services; to co-ordinate federal information programs involving more than one department and help other federal agencies improve the quality and effectiveness of their information work, through the provision of professional personnel and resource assistance when so requested; to maintain marketing and distribution facilities for all federal publications and to initiate information programs where the public need is clearly identified and the responsibility does not fall under any one specific department.

The agency now operates regional inquiry centres in six major cities across Canada and plans to open five more, thus creating a coast-to-coast network. These centres are gradually branching out beyond the urban areas through the use of mobile information officers.

When it was created, Information Canada took over the publishing and bookselling functions of the Queen's Printer. In addition to operating its own bookstores, it is developing a network of authorized agencies, using qualified commercial booksellers for the sale of Canadian Government publications throughout Canada.

The agency is also responsible for the former Canadian Government Exhibition Commission, now the Information Canada Audio-Visual/Expositions Branch, and the former Still Photo Division of the National Film Board, now Information Canada Photothèque.

Federal government information services are not centralized in Information Canada. The information resources of the various departments are at the service of the public to answer inquiries about their specific activities, while Information Canada acts as a central contact point.

Information Canada reports to Parliament through the Minister of Labour.

Statistics Canada, established in 1918 as the Dominion Bureau of Statistics, is Canada's central statistical agency and as such is the country's main collector and publisher of information about Canadian economic and social life. The agency, given its present name in 1971, has been a separate department of government since 1965 and reports to Parliament through the Minister of Industry, Trade and Commerce.

One of Statistics Canada's key jobs is conducting the Census of Canada at five- and ten-year intervals; the latest ten-year Census was in 1971 and the next five-year Census will be in 1976. The bureau also undertakes a comprehensive Census of Agriculture at the same time as the general censuses and regularly surveys social and economic change under more than 20 broad subject-matter headings such as the monthly labour force and consumer prices surveys.

The growth of Statistics Canada, both in personnel and in the complexity of statistical activity, has paralleled Canada's development as a modern industrial state. The agency's staff, which includes the largest single body of social scientists in one organization in Canada, has more than doubled in the past 15 years to about 4,000 in 1973. Several hundred additional persons are employed part-time on such projects as special surveys and censuses.

Statistical collection by the bureau covers every area of Canada and ranges from the well-known national assessments such as the national accounts to minute census detail. The information produced describes quantitatively Canada's economic and social environment and is used mainly as an aid to decision-making and research. The public sector uses the information for the development of social and economic policies and the private sector uses it extensively for decisions in marketing and merchandising and the establishment of branch plants and retail outlets.

Most Statistics Canada information is made available to the public through publications but for more sophisticated users there is an increasing output on micro-film, computer tapes and special tabulations. In the most recent count, there were more than 1,100 publications. Of these, some appear monthly or more frequently, some quarterly, some annually, and others every two or three years. The publications flowing from the national censuses include 278 for 1961, 122 for 1966 and more than 300 based on the 1971 Census. Some general publications are issued occasionally and include special studies and manuals. Statistical reports are increasingly published in bilingual form or appear in separate English and French editions. About 1.3 million copies of Statistics Canada publications are issued yearly on a subscription basis.

Geocoding, known formally as the Geographically Referenced Data Storage and Retrieval System (GRDSR), is one example of the sophisticated tools the bureau uses for processing data and providing statistical information. Through GRDSR, certain statistical information can now be quickly and inexpensively obtained about areas as small as a few city blocks in major cities.

Another example of Statistics Canada's capability for the storage and speedy processing of information is the Canadian Socio-economic Information Management System (CANSIM). CANSIM stores and updates hundreds of series of information on such topics as prices, industrial production, trade, and national accounts. Most series cover statistics for several years. Information tailored to user requirements is provided on computer tapes or in table form.

The publications program includes the statistical information from each subject area that is most commonly used. Special tabulations are issued in response to requests for more detail.

In addition to the publications program, there is considerable distribution of statistical information through newspapers, magazines, trade journals, trade associations and radio and television broadcasts. Much of Statistics Canada material is used in a wide range of reference publications such as year books and encyclopedias and is incorporated into research studies, books, learned journals and in a great variety of other public and private documents.

The principal vehicle for informing the public about the bureau's output is the free Catalogue of publications, issued annually. It can be obtained by writing to Publications Distribution, Statistics Canada, Ottawa K1A 0T6. The Catalogue lists and describes all publications, grouped by subject areas. A commodity index lists several thousand entries arranged in alphabetical order and cross-referenced where necessary to show several publications in which information on a given subject may be found.

Statistics Canada publications may be obtained from the bureau headquarters, by using the order form supplied with the Catalogue, and through regional offices at St. John's, Halifax, Montreal, Ottawa, Toronto, Winnipeg, Edmonton, and Vancouver. Frequently used publications are stocked in Information Canada bookstores in principal cities. Major public and university libraries, provincial libraries and the National Library at Ottawa have Statistics Canada publications available for reference and the Statistics Canada library in Ottawa has all publications issued since the bureau was established.

Index to special articles published in previous editions of the Canada Year Book

Agriculture

- Historical background of Canadian agriculture, G.S.H. Barton. 1939 pp. 187-190.
The major soil zones and regions of Canada, P.C. Stobbe. 1951 pp. 352-356.
The Board of Grain Commissioners, W.J. MacLeod. 1960 pp. 957-958.
The Canadian Wheat Board and its role in grain marketing, C.B. Davidson. 1960 pp. 958-960.
Changes in Canadian agriculture as reflected by the Census of 1961. 1963-64 pp. 409-415.
Contribution of the Canada Department of Agriculture to modern agricultural science. 1966 pp. 457-461.
Federal assistance in livestock improvement. 1967 pp. 453-457.
The role of government in the grains industry. 1972 pp. 1021-1028.

Banking and finance

- The Bank of Canada and its relationship to the financial system. 1937 pp. 881-885.
Historical sketch of currency and banking. 1938 pp. 900-906.
Wartime control under the Foreign Exchange Control Board, R.H. Tarr. 1941 pp. 833-835, 1942 pp. 830-833.
Commercial banking in Canada, J. Douglas Gibson. 1961 pp. 1115-1120.

Citizenship

- Early naturalization procedure and events leading up to the Canadian Citizenship Act. 1951 pp. 153-155.

Climate and meteorology

- Factors which control Canadian weather, Sir Frederick Stupart. 1925 pp. 36-40.
Temperature and precipitation of northern Canada, A.J. Connor. 1930 pp. 41-56.
Droughts in western Canada, A.J. Connor. 1933 pp. 47-59.
The climate of Canada, C.C. Boughner and M.K. Thomas. 1959 pp. 23-51, 1960 pp. 31-77.
The climate of the Canadian Arctic, H.A. Thompson. 1967 pp. 55-74.

Communications

- The democratic functioning of the press, W.A. Buchanan. 1945 pp. 744-748.
History and development of the Canadian Broadcasting Corporation, Augustin Frigon. 1947 pp. 737-740.
A history of Canadian journalism, 1752-(circa) 1900, W.H. Kesterton. 1957-58 pp. 920-934.
A history of Canadian journalism (circa) 1900-1958, W.H. Kesterton. 1959 pp. 883-902.
The development of telecommunications in Canada, M.E. Callin. 1967 pp. 862-869.

Constitution and government

- Provincial and local government. 1922-23 pp. 101-115.
The evolution of the Constitution of Canada down to Confederation, S.A. Cudmore and E.H. Coleman. 1942 pp. 34-40.
The British North America Act, 1867. 1942 pp. 40-59.
Canada's growth in external status, F.H. Soward. 1945 pp. 74-79.
The Constitutional development of Newfoundland prior to Union with Canada, 1949. 1950 pp. 85-92.
The terms of Union of Newfoundland with Canada, 1949. 1951 pp. 56-57.
The Privy Council Office and Cabinet Secretariat in relation to the development of Cabinet government, W.E.D. Halliday. 1956 pp. 62-70.
Amendment of the Canadian Constitution, J.R. Mallory. 1961 pp. 51-57.
Yukon Territory and Northwest Territories (historical and current administration of). 1968 pp. 110-116.
The Cabinet Committee System. 1970-71 pp. 79-84.

Crime and delinquency

- A historical sketch of criminal law and procedure, R.E. Watts. 1932 pp. 897-899.
The influence of the Royal Canadian Mounted Police in the building of Canada, S.T. Wood. 1950 pp. 317-331.

Education

- Report of the Royal Commission on national development in the Arts, Letters and Sciences. 1952-53 pp. 342-345.
Structural changes in tertiary education in Canada, Miles Wisenthal and Eve Kassirer. 1972 pp. 370-377.

Fauna and flora

- Faunas of Canada, P.A. Taverner. 1922-23 pp. 32-36.
Faunas of Canada, R.M. Anderson. 1937 pp. 29-52.
Migratory bird protection in Canada. 1951 pp. 38-43.
The barren-ground caribou. 1954 pp. 33-36.
Migratory bird legislation. 1955 pp. 41-45.
The musk-ox. 1957-58 pp. 28-30.
Provincial government wildlife conservation measures. 1963-64 pp. 46-52.
The flora of Canada, H.J. Scoggan. 1966 pp. 35-61.
Animal life in Canada today, Scientists of the Zoology Division, National Museum of Canada. 1968 pp. 47-60.

Fisheries

- Groundfish species in the Canadian fisheries, T.H. Turner. 1957-58 pp. 591-595.
Canada's commercial fishery resources and their conservation. 1960 pp. 625-630.

Forestry

- Physiography, geology and climate as affecting the forests. 1934-35 pp. 311-313.
 The pulp and paper industry in Canada. 1952-53 pp. 467-475.
 The federal-provincial forestry agreements, H.W. Beall. 1956 pp. 459-466.
 The Pulp and Paper Research Institute of Canada, Rielle Thomson. 1957-58 pp. 489-491.
 Canadian forest products and changing world markets, J.T.B. Kingston. 1965 pp. 511-517.

Fur trade

- The development of marshlands in relation to fur production in the rehabilitation of fur-bearers, D.J. Allan. 1943-44 pp. 267-269.
 The fur industry, W.M. Ritchie. 1961 pp. 618-622.

Geology

- Geology in relation to agriculture, Wyatt Malcolm. 1921 pp. 68-72.
 The Geological Survey of Canada, J.M. Harrison. 1960 pp. 13-19.
 Geology and economic minerals of Canada, W.D. McCartney. 1967 pp. 19-32.

History

- Canadian chronology, 1497-1960. 1951-60.

Labour

- History of the labour movement in Canada, Eugene Forsey. 1967 pp. 773-781.

Manufactures

- Changes in Canadian manufacturing production from peace to war, 1939-44. 1945 pp. 364-381.
 Manufacturing production during the period 1945-59, A. Cohen. 1962 pp. 600-609.
 The petrochemical industry in Canada, G.E. McCormack. 1962 pp. 609-615.
 Secondary manufacturing in Canada, W.L. Posthumus. 1963-64 pp. 637-643.
 Manufacturing and the changing industrial structure of the Canadian economy, 1946-65. 1967 pp. 665-678.
 Technology, markets and costs in manufacturing. 1968 pp. 689-694.
 Origin and destination of Canadian manufacturers' shipments. 1970-71 pp. 794-799.
 Trends in the number of manufacturing establishments. 1972 pp. 768-778.

Mining

- Mines and minerals — a historical sketch. 1939 pp. 309-310.
 The coal deposits and coal resources of Canada, B.R. MacKay. 1946 pp. 337-347.
 History of pipeline construction in Canada, G.S. Hume. 1954 pp. 861-869.
 Canadian metallurgical development, John Convey. 1961 pp. 513-522.
 Geology and economic minerals of Canada, W.D. McCartney. 1967 pp. 19-32.

Fuels in Canada, A. Ignatieff. 1969 pp. 637-645.

Federal research advances Canadian mineral development, John Convey. 1970-71 pp. 723-730.

Physiography and related sciences

- Physical geography of the Canadian eastern Arctic, R.A. Gibson. 1945 pp. 12-19.
 Hydrographical features, F.C.G. Smith. 1947 pp. 3-12.
 Physical geography of the Canadian western Arctic, R.A. Gibson. 1948-49 pp. 9-18.
 The drainage basins of Canada. 1961 pp. 16-18.
 Economic regions of Canada, N.L. Nicholson. 1962 pp. 17-23.
 Main physical and economic features of the provinces and territories. 1963-64 pp. 4-20.
 Geophysics, G.S. Garland. 1963-64 pp. 57-60.
 Federal government surveying and mapping, Mary J. Giroux. 1965 pp. 17-24.
 Astronomy in Canada, Ian Halliday. 1965 pp. 47-55.
 Growth of geographical knowledge of Canada, Trevor Lloyd. 1967 pp. 1-6.
 Geology and economic minerals of Canada, W.D. McCartney. 1967 pp. 19-32.
 Archaeology in Canada, Scientists of the National Museum of Man. 1968 pp. 20-29.
 Resource and economic development north of the 60th parallel. 1970-71 pp. 58-64.
 Regional geography of Canada, J. Lewis Robinson. 1972 pp. 1-26.

Population

- Occupational trends in Canada, 1891-1931, A.H. LeNeveu. 1939 pp. 774-778.
 Developments in Canadian immigration. 1957-58 pp. 154-176.
 Integration of postwar immigrants. 1959 pp. 176-178.
 Use of the English and French languages in Canada, A.H. LeNeveu. 1965 pp. 180-184.
 Mobility of Canada's population, 1956-1961, Y. Kasahara. 1966 pp. 179-187.
 Recent trends in urbanization and metropolitan growth, Leroy O. Stone and Frances Aubry. 1969 pp. 156-165.
 Trends in population growth in Canada with special reference to the decline in fertility, M.V. George. 1970-71 pp. 213-220.

Research

- The International Geophysical Year, D.C. Rose. 1957-58 pp. 35-38.
 The Fisheries Research Board, J.L. Kask. 1959 pp. 584-588.
 Geophysics, G.S. Garland. 1963-64 pp. 57-60.
 The Fisheries Research Board of Canada. 1963-64 pp. 612-614.
 Astronomy in Canada, Ian Halliday. 1965 pp. 47-55.
 A selection of Canadian achievements in science and technology, 1800-1964, John R. Kohr. 1965 pp. 398-401.

Trade

Canada's participation in the changing pattern of world trade, 1953-66, A.M. Coll. 1967 pp. 953-966.

Canada's international trade after the Kennedy Round of trade negotiations, G.A. Richardson. 1968 pp. 946-954.

Canada's trade with the European Economic Community, D. Paul Ojha. 1969 pp. 977-985.

Canada's trade with the Pacific Rim Countries, M.P. Mathew. 1970-71 pp. 1069-1078.

The Canada - United States Automotive Products Agreement, W.M. MacLeod. 1972 pp. 1058-1069.

Transportation

The development of aviation in Canada, J.A. Wilson. 1938 pp. 710-712.

Pre-war civil aviation and the defence program, J. A. Wilson. 1941 pp. 608-612.

International Civil Aviation Organization and Canada's participation therein, C.S. Booth. 1952-53 pp. 820-827.

Canals of the St. Lawrence waterway. 1954 pp. 830-833.

History of the Canadian National Railways. 1955 pp. 840-851.

The St. Lawrence Seaway. 1955 pp. 885-888.

Traffic on the Great Lakes - St. Lawrence Seaway. 1956 pp. 821-829.

The St. Lawrence Seaway in operation, S. Judek. 1960 pp. 851-860.

Revolution in Canadian transportation, A.W. Currie. 1962 pp. 753-758.

An outline of the development of Civil Air Transport in Canada, J.R.K. Main. 1967 pp. 838-843.

The first decade of the Seaway, Pierre Camu. 1969 pp. 841-845.

Territorial evolution of Canada (continued from front end leaf)

New Brunswick, Nova Scotia and Canada are united in a federal state, the Dominion of Canada, by the British North America Act (July 1, 1867). The Province of Canada is divided into Ontario and Quebec. The United States of America proclaims the purchase of Alaska from Russia (June 20).

The North-West Territories (Rupert's Land and the Hudson's Bay Company (1870). From part of them Manitoba is created as the sixth province (1870).

The Ontario-Manitoba boundary dispute is settled by the Ontario Boundary Act (1889). The District of Yukon becomes a Territory separate from the North-West Territories (1898). Alberta and Saskatchewan are created as provinces to make a total of nine provinces in the Dominion of Canada (1905). The District of Keewatin is transferred back to the Northwest Territories. Due to changes in adjoining areas the boundaries of the Northwest Territories are redefined (1906).

Ontario and Manitoba attain their present boundaries (1905). The Northwest Territories are extended northward to Hudson Bay and Hudson Strait. The District of Keewatin is transferred back to the Northwest Territories. Due to changes in adjoining areas the boundaries of the Northwest Territories are redefined (1906).

1873

in Territory) are acquired by Canada from the Hud-
son's Bay Company (1870). British Columbia joins
the Confederation as the seventh province (1873).

1882

New provisional northern and western boundaries of Ontario are described (1874). The District of Keewatin is created (1876). British rights to the arctic islands pass to Canada (1880). The boundaries of Manitoba are extended (1881), but the extension to the east is contested by Ontario. The provisional Districts of Assiniboia, Saskatchewan, Athabasca, and Alberta are created (1882).

1912

1949

The Imperial Privy Council provides a settlement of the Quebec-Labrador boundary question (1927). At its own request, after a plebiscite, Newfoundland enters the Confederation (1949).
